I. Executive Summary

Vision Statement

After more than sixty years of operation as a military facility, the closure of Naval Station Roosevelt is providing the Commonwealth of Puerto Rico with an opportunity to maximize the assets and attributes of this facility in the way that is most beneficial to its citizens, particularly the residents of Ceiba, Naguabo and the surrounding communities. To this end, three principles have guided the work of the Commonwealth Government in planning for the reuse of this facility: (1) encourage community participation, (2) promote activities that will create jobs and contribute to the economic vitality of Puerto Rico, and (3) protect and preserve the natural resources that add to the beauty of this region. With these three principles in mind, the Commonwealth Government envisions an unprecedented opportunity for the people of Puerto Rico to turn an area that is currently inaccessible to most of them into an engine of sustainable economic development.

Background and Setting

In late September 2003, the U.S. Congress directed the Secretary of the Navy to close Naval Station Roosevelt Roads ("Roosevelt Roads", "NSRR" or the "Base") within six months and to do so pursuant to the Defense Base Realignment and Closure Act of 1990 (commonly referred to as "BRAC"). That event triggered a series of actions organized around the need to prepare a Reuse Plan for the Base in an extraordinarily short period of time. By comparison, the average time for the closure of a base under BRAC has ranged from three to four years. On March 31, 2004, the NSRR ended operations.

This Reuse Plan is intended to guide the transformation of the Base from military to civilian uses. It describes land uses proposed for the 8,600-acre site and also addresses phasing, infrastructure, and costs associated with preparing the site for reuse.

Reuse Plan Overview

This section describes the major elements of the Reuse Plan including proposed land uses, phasing of development, infrastructure improvements and projected costs.

Proposed Land Uses: The Reuse Plan for Roosevelt Roads is the result of a comprehensive analysis of the site's regional context, its existing natural physical conditions and facilities, and the market demand for alternative uses, as well as consideration of significant community input regarding uses and services that should be accommodated at the Base. Preparation of this plan was driven by an overarching goal of lessening the immediate negative impact on the surrounding region while creating a dynamic reuse plan that will lead to the socio-economic development of the region and the Commonwealth of Puerto Rico.

The land uses that have been incorporated into the Roosevelt Roads Reuse Plan can be summarized within six broad categories including: Economic Development; Public, Educational and Institutional Use; Residential; Open Space and Recreation; Conservation; and Tourism. Each is described below.

- **Economic Development (Job Generating) Uses:** One of the key objectives for reuse of the Base is to emphasize economic development. Accordingly, the plan calls for creation of a science park with research and development facilities, a substantial amount of industrial and commercial development, and water-oriented commercial and recreational activity. At full build-out over 34-plus years, total jobs created would range from 18,200 to 19,700. Targeting jobs requiring investment of intellectual capital will be one of the most important goals of the reuse effort for Roosevelt Roads.
- **Public, Educational and Institutional Uses:** The Reuse Plan incorporates a number of public, educational and institutional uses that focus on reusing

specific facilities at the Base. Many are suitable to be taken over and operated by various public agencies of the Commonwealth. Examples include the Puerto Rico Electric Power Authority (PREPA), the Puerto Rico Aqueduct and Sewer Authority (PRASA), the Puerto Rico Ports Authority (PRPA), the Department of Education, and universities and other academic institutions. Specifically, the following uses are included in the plan:

- The existing airport as a passenger and cargo facility;
 - The waterfront adjacent to the harbor as a new passenger and light cargo terminal;
 - The Base hospital as an emergency room and hospital serving the local community;
 - The Base elementary school as a public middle/high school;
 - The Base middle/high school campus as a private bi-lingual private school; and
 - A cluster of existing academic, residential and support buildings/facilities as an integrated university campus
- **Residential Uses:** A broad range of sites appropriate for residential development has been identified. These occur in the southwest portion of the site in an area known as "Bundy", in the "Downtown" central section of the site, and on the southern peninsula where several hundred existing homes are located. The Base is large enough to offer a broad range of potential residential building types and densities, with a range of appropriate amenities.
 - **Open Space and Recreation Uses:** Numerous recreational opportunities are incorporated in the Reuse Plan, supporting residential and tourism objectives. Among these are:

Roosevelt Roads Reuse Plan

- Expansion of the existing marina and development of adjacent water-oriented and water view recreational uses that could include tennis, miniature golf, kayak rental, water-skiing and parasailing, small boat rentals, etc., with associated retail;
 - Continued use of the existing 9-hole golf course and potential expansion to an 18-hole public course;
 - Development of new marina opportunities at the outer harbor of Bahia de Puerca.
- **Conservation Area:** For the past six decades, under the Navy's stewardship, thousands of acres of coastal mangrove forests and wetlands have remained undeveloped. As the importance of the eastern region of Puerto Rico's biodiversity emerges, support for continued conservation of the site's natural areas has grown. The Reuse Plan calls for preserving almost 3,400 acres of mangrove forests and wetlands as a conservation area.
 - **Tourism:** Several uses linked to tourism are incorporated in the Reuse Plan:
 - The Commonwealth recognizes the need for the development of moderate tourism in Puerto Rico and this use can be accommodated in a number of locations at the Base, capitalizing on beautiful views and accessibility to water-oriented and ecotourism-oriented activities.
 - There is tremendous growth in the hotel sector along the eastern coast as well as the expansion of tourism in Vieques and Culebra. In the short- to intermediate-term, these planned hotel projects will likely fulfill the demand for resort development at the higher end of the market. However, in the longer term, this use could become a viable use at Roosevelt Roads.
 - Roosevelt Roads is an ecologically significant site. Preservation of nearly 50% of its land area

and an even greater percentage of its coastline will achieve a high degree of flora and fauna habitat sustainability. This opportunity will support ecotourism activity

Phasing: The redevelopment of the Base will, of course, occur in phases over many years. Accordingly, a 34-year phasing program has been prepared as part of the Reuse Plan. It is, by necessity, illustrative and will vary depending on actual market conditions, availability and commitment of funding, policy decisions by the Commonwealth of Puerto Rico and by the Navy, and the level of interest and commitment by private sector developers, investors, and users.

Infrastructure Improvements and Costs: Substantial infrastructure improvements will be needed to support the Reuse Plan. This includes significant road improvements as well as utility upgrades (water, sanitary sewer, storm drainage, electricity and telecommunications). As part of this Reuse Plan, existing capacities were identified and compared to proposed reuses and new development to determine the need for upgrading and/or expansion of the current road and utility systems. Costs to upgrade and expand roads and utility systems are preliminarily estimated at \$102 million in 2004 dollars. This figure represents full build-out of the Base, but excludes system upgrades for federal transfers and for some of the potential public benefit and economic development conveyances and upgrades to systems to make them acceptable to, and code compliant with, utility authorities that may take over the systems from the Navy. As estimated by the Puerto Rico Aqueduct and Sewer Authority (PRASA) and the Puerto Rico Electric Power Authority (PREPA), the costs associated with upgrades to the water/wastewater and electrical systems are approximately US \$5.4 million and US \$3.2 million, respectively.

Funding for these improvements could come from several sources. For example, the entities that acquire

Roosevelt Roads Reuse Plan

portions of the Base from the Navy would be expected to incur some or all of these costs, depending upon the terms of disposition agreements between the Navy and future buyers. It is also likely that the Commonwealth would incur some of these infrastructure costs, again depending on the overall terms of disposition agreements it enters into with the Navy.

Organization of this Report

This report is designed to present the results of the Local Redevelopment Authority's ("LRA") assessment of reuse opportunities for Roosevelt Roads. Following the Executive Summary, the report is organized as follows:

- **Introduction:** an overview of the planning process, its goals and objectives, and a review of the public participation process;
- **Site, Context and Physical Conditions:** an assessment of the existing conditions characterizing the site, including location; physical conditions; natural features; environmental, transportation and infrastructure and the condition of existing buildings;
- **Market Analysis:** an evaluation of market conditions that will determine the economic feasibility of various reuse options;
- **Land Use:** a presentation of recommended land uses;
- **Urban Design Framework Plan and Design Principles:** a vision of what the Base can become if proper attention is paid to certain overarching design principles and guidelines. This section is intended to illustrate that through conscientious and thoughtful planning, the potential for the Base's redevelopment—and its value—will be dramatically enhanced;
- **Infrastructure: Circulation, Utilities and Public Services:** describes in a conceptual manner the major road, utility and other infrastructure improvements needed to support the plan; also included are order of magnitude estimates of major capital improvements needed to implement the Reuse Plan; and
- **Notice of Interest Responses for Public Benefit Conveyances:** a presentation of expressions of interest by various public entities, not-for-profit organizations and private companies for reusing portions of the Base.

II. Introduction

The Planning Process

There are important measures of success that are common to military base reuse projects. Among the most critical are strong local leadership and the involvement of local community groups and stakeholders in the consensus-building process. On October 24, 2003, shortly after the process to close NSRR began, Governor Sila María Calderón signed Executive Order #OE-2003-66 appointing the Puerto Rico Department of Economic Development and Commerce as the Local Redevelopment Authority (“LRA”), the entity responsible for planning the redevelopment and reuse of NSRR and the sole entity recognized by the federal government to work and negotiate with the United States Navy on the future of NSRR. The Governor also appointed a Redevelopment Committee (“RC”) to act as an advisory group on all matters regarding the development process.

The LRA was recognized by the Office of Economic Adjustment (“OEA”) of the Department of Defense on November 20, 2003. The RC consists of:

- ❑ Secretary of Economic Development and Commerce, *Chair*
- ❑ Resident Commissioner
- ❑ Secretary of Environmental and Natural Resources
- ❑ President of the Planning Board
- ❑ Executive Director of the Puerto Rico Tourism Company
- ❑ Executive Director of the Ports Authority
- ❑ Mayor of the Municipality of Ceiba
- ❑ Mayor of the Municipality of Naguabo
- ❑ Representative of the business community of Ceiba
- ❑ Representative of the community of Ceiba
- ❑ Representative of the community of Naguabo

Roosevelt Roads Reuse Plan

The LRA retained a consulting team lead by CB Richard Ellis Consulting (the “Consulting Team”) to assist in its efforts to identify opportunities for the Base and to formulate a Reuse Plan. The Consulting Team is composed of:

- ❑ CB Richard Ellis Consulting:
Real Estate and Development Advisors
- ❑ Cooper, Robertson & Partners:
Architecture and Urban Design
- ❑ Moffatt & Nichol: Engineering
- ❑ Puerto Rico Management & Economic
Consultants, Inc.: Economics

Additional support to the LRA was provided by:

- ❑ Matrix Environmental Services: Environmental
- ❑ Garrity & Knisely: BRAC Counsel
- ❑ Winston & Strawn LLP: General Counsel
to the LRA

Goals and Objectives

Preparation of this Reuse Plan for NSRR was driven by an overarching goal of lessening the immediate negative impact on the surrounding region while creating a dynamic reuse plan that will lead to the socio-economic development of the region and the Island. The specific objectives of the Reuse Plan are as follows:

- To promote activities that will create jobs and contribute to the economic vitality of Puerto Rico;
- To expand Puerto Rico’s capability to produce high-value products, including those that can be exported by air freight to the U.S. mainland and to other countries;
- To attract increased investment from technology-based companies including the pharmaceutical industry,

building upon the existing foundation of manufacturing activity and expanding into product development and research;

- To ensure that the Reuse Plan provides flexibility to accommodate changing economic conditions and public needs;
- To take advantage of the Base's unique size and location on Puerto Rico's eastern coast, as well as its spectacular views and physical characteristics;
- To use the uniqueness of the site as a feature to draw activities that are otherwise difficult for Puerto Rico to attract; and
- To capitalize on the site’s waterfront setting for recreational uses and ecotourism opportunities as well as for residential and other appropriate commercial uses.

Public Participation and Planning Process

Pursuant to the Department of Defense Appropriations Act, 2004, enacted on September 30, 2003, Naval Station Roosevelt Roads, located in the Municipalities of Ceiba and Naguabo, closed on March 31, 2004.

This rapid pace of closure of a base, which was estimated by the U.S. Navy to generate approximately \$300 million in economic activity, affecting the two municipalities located in a small, rural community on the east coast of Puerto Rico, as well as to the rest of the region. The closure of NSRR in this hastened manner is resulting in the loss of economic activity in the region, increased unemployment and, in a best case scenario, short-term losses in investment and development potential in the vicinity of NSRR.

The Government of the Commonwealth of Puerto Rico (the “Commonwealth”) decided to view the closure as an opportunity to reclaim lands long held in military use and to reintegrate them to the adjacent communities. It

Roosevelt Roads Reuse Plan

is the vision of the Commonwealth that the lands comprising the former NSRR play an important role in providing opportunity and wealth for the people of Puerto Rico through a sustainable economic development strategy. Moreover, the re-development of the property will play a critical role in increasing economic activity, expanding the tourism opportunities and enhancing the attractiveness of the region.

Due to the expected immediate impact on the region, issues of importance to the community ranged from environmental protection, access to potable water, loss of a major employment center, reasonable development controls on hotels and residences, and access to affordable housing. To this effect, and from its inception, the LRA acknowledged that the communities adjacent to the Base needed to be an integral part of the development of the lands of the former Naval Station Roosevelt Roads and that the LRA would need to allocate a significant amount of time and resources into a community outreach program. In essence, the mission and objectives of the LRA were to ensure community participation at a variety of different levels.

Since access to computers, and in some cases telephones, was scarce in the communities of Ceiba and Naguabo, and since the majority of the community speaks only Spanish, the LRA decided upon a community outreach strategy that would successfully incorporate the citizens of these municipalities into the planning and re-development process.

First, and in order to ensure community representation in the planning and redevelopment of the property, and pursuant to Executive Order #OE-2003-66, the Governor appointed two residents of Ceiba, and one in Naguabo to the Redevelopment Committee, the entity tasked with working with the LRA in developing a reuse plan. Mr. Rubén Tiburcio, as business representative, Mr. Ramón Carreras, as community representative of Ceiba, and Ms. Mildred Cuevas, community representa-

tive of Naguabo, actively participated in all evaluations and decisions presented for the consideration of the RC. In addition, the Mayors of Naguabo and Ceiba are also members of the RC.

In order to address community concerns and to ensure local participation, the RC created subcommittees that were to be principally composed of residents of Ceiba and Naguabo. The subcommittees created included:

- Planning and Property Uses
- Environment
- Housing and Homeless
- Human Resources
- Economic Development
- Infrastructure
- Health and Education

More than 55 citizens from the Eastern region of Puerto Rico actively participated in the sub-committees, providing insightful and enthusiastic policy recommendations and suggestions related to the future of the former base.

In order to understand the community's existing needs, from October until the end of June, 2004, the LRA also made numerous trips and visits to the area to meet with community leaders, community organizations, displaced workers, industry leaders, local stakeholders and other affected parties. These efforts also included holding community meetings, community educational workshops and two Public Hearings, held on April 22 and May 17, in an effort to obtain all possible input for the development of this Reuse Plan. From the end of October until the month of June, the LRA conducted over 64 meetings, workshops or events for the residents of Ceiba, Naguabo and the surrounding communities. Also, the LRA received input from the region's two community associations, CADEC and

Roosevelt Roads Reuse Plan

APRODEC, to listen to their concerns and suggestions. It proved to be a significant way to gather information about the most pressing needs of the communities adjacent to the Base.

As mentioned before, the LRA actively coordinated activities and workshops to inform the communities of the government programs and funding, available for retraining, to start up companies and small business loans. The Administration for the Training of Future Workers (“AAFET”) has offered two presentations in Ceiba and Naguabo explaining the programs the agency offers, including Technical and Vocational Schools and the Business Start Up Programs. The Commerce and Export Company offered an orientation to the communities regarding the various programs and aids available to the local business communities. These include Mitigation Plans, Commercial Impact Programs, Business School Courses, Puerto Rico Power and Electric Authority’s Incentives for small businesses and the opening of a commercial office in Ceiba. For its part, the Puerto Rico Tourism Company (“PRTC”) and the Economic Development Bank (“EDB”) offered a workshop called “Financial Incentives for the Tourism Industry”. These incentives include the Tourism Guarantee Fund, which was created between PRTC and the EDB, where PRTC transferred \$1 million to the EDB to guarantee the financing of small and medium sized business in the tourism industry. The other incentive is Law 78, which grants tax credits for tourism investments and construction.

One of the more crucial aspects of the Base’s closure was the immediate impact on the area’s workers. One of the LRA’s most important tasks was to evaluate the number of displaced workers and their skills, and to provide for their benefit placement assistance, retraining capacity, economic incentives and job replacement efforts. Beginning in March 2003, the Government of Puerto Rico through the Consejo de Desarrollo Ocupacional y Recursos Humanos and the Consorcio del Noreste/Rio Grande (collectively, el “Consejo”) proactively established

a Support Center on the Base to provide assistance to workers that were being relocated or displaced. On June 29, 2004, the LRA, in conjunction with other government agencies of the Commonwealth of Puerto Rico held an Employment Fair in the Municipality of Ceiba, for the displaced workers from the Base. With the attendance of over 269 workers, and over 567 employment offers, it was a complete success. A total of 142 workers were referred to employers and 10 of these were offered positions by companies present at the Fair. Ample media coverage was received describing the success of the event.

By the end of June, 931 workers had been displaced by the Base. However, 578, or 62%, had already been placed in alternate employment in positions such as engineers, secretaries, accountants, salesmen, and technicians.

Most importantly, the Commonwealth has approved legislation, signed into law by the Governor, to create a combined fund of \$23 million to help the communities of Ceiba and Naguabo (\$15 million in Commonwealth funds and \$8 million in federal funds already available from the WIA program). These funds are intended to cover the costs of the programs being designed and implemented for the communities’ benefit. They include:

1. Relief Fund to Municipalities of Ceiba and Naguabo for losses in patents and taxes: The Legislation creates a special fund that alleviates the reduction in collections during the 2004, 2005 and 2006 fiscal years. The cost of this program is estimated in \$4.5 million until FY 2006.
2. Small Business Fund for the Roosevelt Roads Communities: The Legislation establishes an office of the Commerce and Export Company in Ceiba to help those displaced workers that wish to establish their own business. Technical business skills will be provided, as well as assistance in dealing with the Economic Development Bank so they are able to receive the Bank’s benefits rapidly. Also proposed was a monthly subsidy of \$1,000 during a 12-month period that would

Roosevelt Roads Reuse Plan

be provided to up to 500 workers who develop and start implementing a business plan. With this aid, an income is guaranteed during the initial period of establishing the business. The cost of this program is estimated at \$6 million.

3. Retention Stimulus and Job Creation: The Legislation directs the Commerce and Export Company to establish in Ceiba and Naguabo a subsidy for those businesses that retain current jobs and/or hire displaced workers from the Base. This subsidy will be up to 50% of the minimum wage, with a 5 employee maximum per establishment and a total of 300 employees. The cost of this program is estimated in \$3.2 million over two years.

The LRA has also been successful in distributing the personal property declared surplus by the Navy. The Municipalities of Ceiba and Naguabo, among other municipalities and government agencies, have received property which was declared in excess by the U.S. Navy after the closure of the Base. The Municipality of Ceiba received cars, electric generators, monitors, a boat, furniture; and Naguabo received cars, electric generators, a school bus and construction materials. Also, the Municipalities of Fajardo, Maunabo, Humacao, Luquillo, Río Grande, Las Piedras, Loíza, Moca, Aguada, Arecibo, Barceloneta, Naranjito, Camuy, Lares and Cataño have received office furniture, vehicles and construction equipment, among other articles.

The LRA requested the medical equipment which belonged to the Hospital such as stretchers, hospital beds, treatment tables, examination and operation tables, ultrasonic equipment, X-ray units, lights for surgery rooms and respirators for future hospital use. The

Electric and Power Authority received 4 generators which belonged to the Navy which will be used in their eastern region operations; while the Ports Authority was authorized to retain the air traffic control equipment, which was located at the airport control tower, as well as trucks, generators and platforms. The Department of Natural Resources received trucks, pickups, office equipment and generators and the Corrections Department received school buses and a tow truck. Other entities which have benefited from this process include the Police Department and various non-profit entities and schools.

As part of the communications effort with the community, the LRA created the Spanish and English website, planrooseveltroads.com to offer the latest information regarding the Base Closure and Realignment Law and the reuse process. The website also allowed members of the community to express their existing needs and submit proposals, ideas, recommendations and suggestions on the possible reuse of the property. A collection of documents regarding the base, including maps, environmental documents and infrastructure assessments, was also made available to the community through the public library of the Municipality of Ceiba.

This Reuse Plan, together with the Homeless Assistance Submission was presented in draft form to the public on October 12, 2004. Fifty-three persons attended a Public Hearing conducted on November 8, 2004. Of those in attendance, fourteen individuals presented comments to the Reuse Plan and/or the Homeless Assistance Submission. For a summary of their comments, see the Homeless Assistance Submission. The LRA took into account all comments received during this public hearing, and various changes were made to the Reuse Plan as a consequence of these comments.

III. Site, Context, and Physical Condition

This chapter presents a summary of the site's physical characteristics including:

- Location, Physical Conditions and Natural Features
- Environmental Issues
- Transportation and Infrastructure
- Existing Building Assessment

Most of the information in this chapter is summarized from an earlier report titled *Roosevelt Roads Reuse Plan: Site, Context and Market Conditions*, prepared in April 2004. That report appears in its entirety in the attached Appendix A.

Location, Physical Conditions and Natural Features

The Consulting Team conducted an overview of adjacent neighborhoods, the site's physical conditions and natural features in order to identify the physical development opportunities and constraints associated with the reuse of Roosevelt Roads. Our team collected and reviewed Base and facilities drawings, documents and previous studies and other secondary sources provided by the Navy, other agencies and conservation groups. Amplified by field notes and photographs taken during our field trips to the site, the team's work effort results in a series of analytical drawings illustrating these physical informational layers, and which provide an understanding of the site's unique characteristics, its development constraints and an introduction to the opportunities for future reuse.

Elements considered in the overview included regional and local context, site structure, dimensions, topography and hydrology, existing vegetation, wetlands and ecology, and archeological sites. Existing land uses and supporting infrastructure were identified and mapped, as were the site's varying gradients, which must be considered when

Roosevelt Roads Reuse Plan

identifying areas for potential development. These conditions were then organized as a series of overlays, culminating in a summary of Constraints and Opportunities for future reuse of the Base. (A separate section on Existing Building Assessment is included in Appendix A).

Findings from this investigation are summarized below:

- The site is at the physical center of the Eastern Caribbean region. Excellent air and ship transportation is readily available. The Roosevelt Roads site has the advantage of proximity to existing and new tourist resorts and second home market developing along the eastern coast, as well as to Vieques and Culebra, both in sight of the Base.
- At the foothills of El Yunque and at the edge of the sea, Roosevelt Roads is intrinsically linked to its regional ecology of rainforests, marine habitat, migratory birds, and coastal flora. There is the opportunity to augment a widely recognized emerging regional ecotourism, forming a regional recreational linkage with such tourist sites both within Puerto Rico, Vieques and Culebra, and the islands of the Lesser Antilles Archipelago.
- Ceiba and Naguabo are small neighboring coastal towns, both formerly agricultural, and now primarily residential in character, with supporting small-scale retail and institutional facilities. These towns are visibly impacted by the closure of the Naval operations at Roosevelt Roads, with “For Sale” signs proliferating throughout the residential streets and neighborhoods and now along some of the prime retail sites at the center of town. There is little industry in either town; both were dependent on the Navy for local employment. With the closure of the Base, it appears that many local residents are relocating out of the immediate area. The town has enjoyed beach access on property belonging to the Navy and use of a fishing pier on property controlled by the Department of Natural Resources, both located to the east of the northern entrance.
- Access to the site is limited and circuitous at the northern end of the site and would require reconfiguration and wayfinding. Access to the southern entrance from the regional road network is direct and well marked. Of great advantage, there is the opportunity for direct access to the airport area. The airfield has helipads and multiple runways, the longest over 11,000 feet in length, and as such, can accommodate virtually any size aircraft. While the airfield today is visually screened from outlying areas by heavy vegetation, it could become visible to the main highway with selective tree thinning creating value for new commercial development activity.
- One of the largest coastal properties in Puerto Rico remaining in single ownership, the site encompasses a sweeping 8,300 acres on mainland Puerto Rico plus three smaller islands, Isla Piñeros, Isla Piñenta and Cabeza de Perro that together represent some 300 additional acres. The site geographically is the easternmost extension of the foothills of El Yunque, forming notable, twin “booted” peninsulas that together frame Ensenada Honda, the large and well-protected harbor at the center of the site with a distinctive ring of hills, nearly 300 feet at the highest point. A smaller bay, Bahía de Puerca, presents a second “outboard” opportunity for water-related activity and adjacent development.
- Limited largely by topography and mangrove forest preserves, opportunity for direct access to the water is restricted to a few locations at the site’s small but charming beachfronts, and along the extensively bulkheaded frontage of the harbor along the northern peninsula. Along this formerly industrial waterfront, the infrastructure is sufficient to support a variety of

Roosevelt Roads Reuse Plan

regionally appropriate uses, such as a passenger and cargo terminal to Vieques and Culebra.

- The encircling Delicias Hills influence the direction of the site's surface water drainage in addition to providing dramatic water and coastal views to the north and south. They also serve to contain noise generated by activity at the airfield, which is located in the site's major northeast/southwest valley. Dual views of El Yunque to the west and Island Pineros and Vieques to the east are equally compelling, and can be best seen from two spectacular vantage points, Punto Medio Mundo, jutting into the bay at the northernmost high point of the site, and at the site's dramatic northern eastern "heel" on the peninsula, among the most valuable on the site.
- The richness of natural diversity, of natural flora, extensive wetlands, mangrove forests and surrounding sea grass beds, underscores multiple ecologies and biodiversity present at the site. The site is an important coastal resource and potential habitat for a number of threatened and endangered species including the Yellow Shouldered Blackbird and the West Indian Manatee. Again, under single ownership, this presents a unique opportunity for a comprehensive approach to conservation as well as development. Additionally, there are a number of listed archeological sites potentially warranting future investigation.
- Existing development at the Base falls within several fragmented zones separated by topography, wetlands or land use: the airfield; Bundy to the southwest; "Downtown" at the center of the site; Capehart (residential neighborhoods on the southern peninsula); the waterfront along the northern bulkhead of Ensenada Honda; and Camp Moscrip at the edge of Bahia de Puerca. Each area is dominated by a single land use with sup-

porting adjacent facilities; each is adaptable to reuse or appropriate for redevelopment. Support facilities at the Base are diverse and include a recently renovated hospital, a well-equipped ambulatory care medical and dental facility, two air-conditioned schools, libraries, a theater, a public works building, refrigerated storage areas, commercial buildings of varying sizes and recreational facilities that include tennis courts, a small-boat marina, a fitness center, a nine-hole golf course and a variety of ball fields. As with most military installations and with few exceptions, Base facilities were developed with little regard to aesthetic quality or siting to maximize views, designed to be purely functional and operationally necessary, with minimal support facilities. It is an environment of mostly well-maintained, "no-frills" structures and facilities.

- Infrastructure at the Base was developed in support of specific land uses and zones, and while adequate to support some degree of reuse, it is likely that with reuse of the Base, elements of existing infrastructure will require updating and modification. In particular, the roads, which were not designed to service significant traffic generated by private vehicles, and the piers, which were sized to service naval and tanker vessels rather than passenger ferries or private charter boats, will need to be addressed.
- While the overall site is large at 8,600 acres, including the three islands, new development and redevelopment opportunities are, in fact, limited to a much smaller area. This is due to the presence of significant wetland areas, the 100-year floodplain, and areas with relatively steep slopes (i.e. greater than 15% gradient). The resulting area available for reuse is approximately 3,868 acres.

Environmental Issues

Roosevelt Roads Reuse Plan

- Areas of Concern (AOCs) related to the presence of potential contaminants, and solid waste management units (SWMUs) require further definition and clarification. The Navy's Environmental Assessment, currently underway, will provide additional information regarding these areas and the scope of the potential cleanup, discussed in more detail in the following section.

Matrix Environmental Services, LLC is working with the LRA and the Consulting Team to identify environmental issues and potential constraints upon the redevelopment of the NSRR property. Any environmental issues/constraints identified within this proposed Reuse Plan should be considered preliminary as many of the environmental programs and studies are ongoing and not all information is available at this time. However, a preliminary understanding of the potential environmental concerns at the former NSRR is an important component of the Reuse Plan. No specific environmental issue identified herein limits reuse or new development. However, where environmental issues are identified, it is important to understand the potential for these issues to affect reuse either from a natural resource context or from a regulatory program context. Natural resource issues will limit the types of use in specific areas to protect sensitive species and/or environments. Regulatory program issues may require some form of site remediation/restoration prior to reuse.

The environmental issues can be divided into two types of analyses: those related to industrial operations and the regulatory programs that these types of operations are managed under, and the second, a natural resource analysis, i.e. threatened and endangered species, historical and archeological sites, and other natural resource preservation issues. The Navy prepared an Integrated Natural Resource Plan (INRMP) in 1988. Although not current, the plan does identify some of the preliminary natural resources that have been identified on NSRR to date. Figure III.1 indicates the archeologically sensitive areas and Figure III.2 indicates the locations of the wetlands, including mangroves identified at NSRR in the 1988 INMRP. A site wide Environmental Assessment (EA) is currently being prepared by the Navy as required under the National Environmental Policy Act (NEPA) for NSRR due to the change in use of the facility from a naval support facility to proposed multi-use redevelopment. The EA will identify all of the natural resource issues identified at NSRR and assess the potential impacts to those resources as part of the change of use of NSRR. Because the EA analysis has not been completed as of the date of this Reuse Plan, additional environmental constraints may be identified as a result of the completed EA. According to the Navy, the EA is scheduled to be completed in March of 2005.

NSRR has been an active military facility from 1943 through 2004, primarily as a mobilization point for military training/maneuvers and as a support facility. In this role, the primary industrial uses of NSRR were as a marina, airport, munitions storage and armed forces training. As a result, the environmental issues related to the industrial uses of the site are fuel related (jet fuels, marine fuels, diesels, and solvents usage and storage), landfills (all onsite disposal since the 1940s) and munitions storage.

Roosevelt Roads Reuse Plan

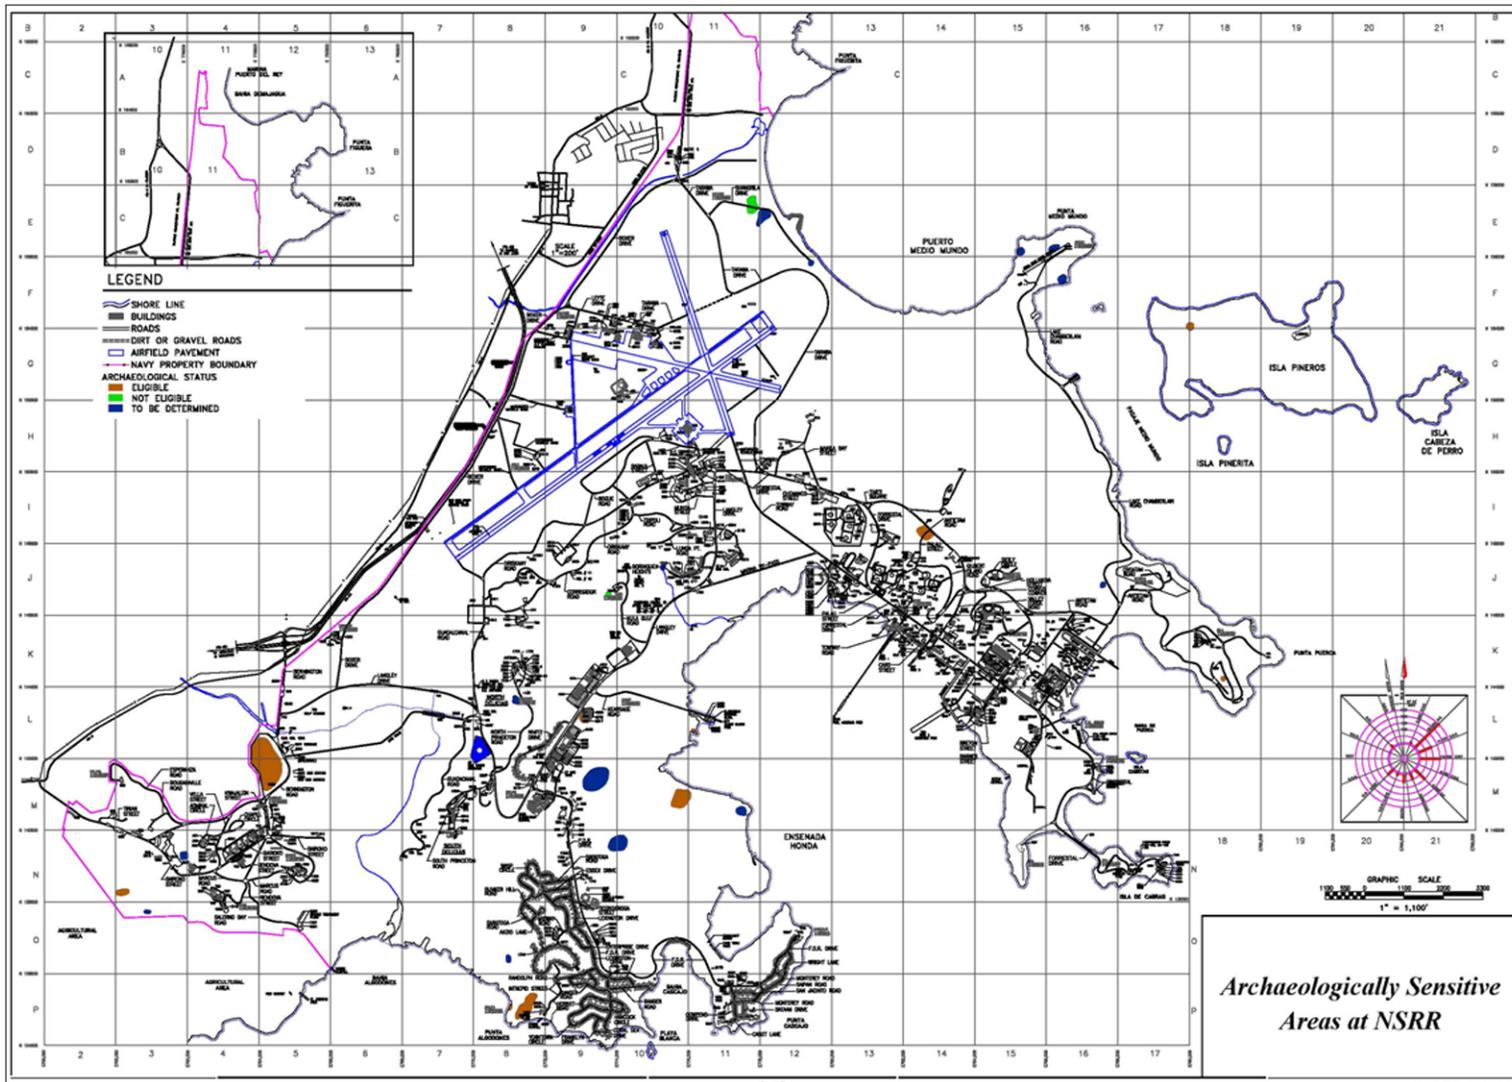

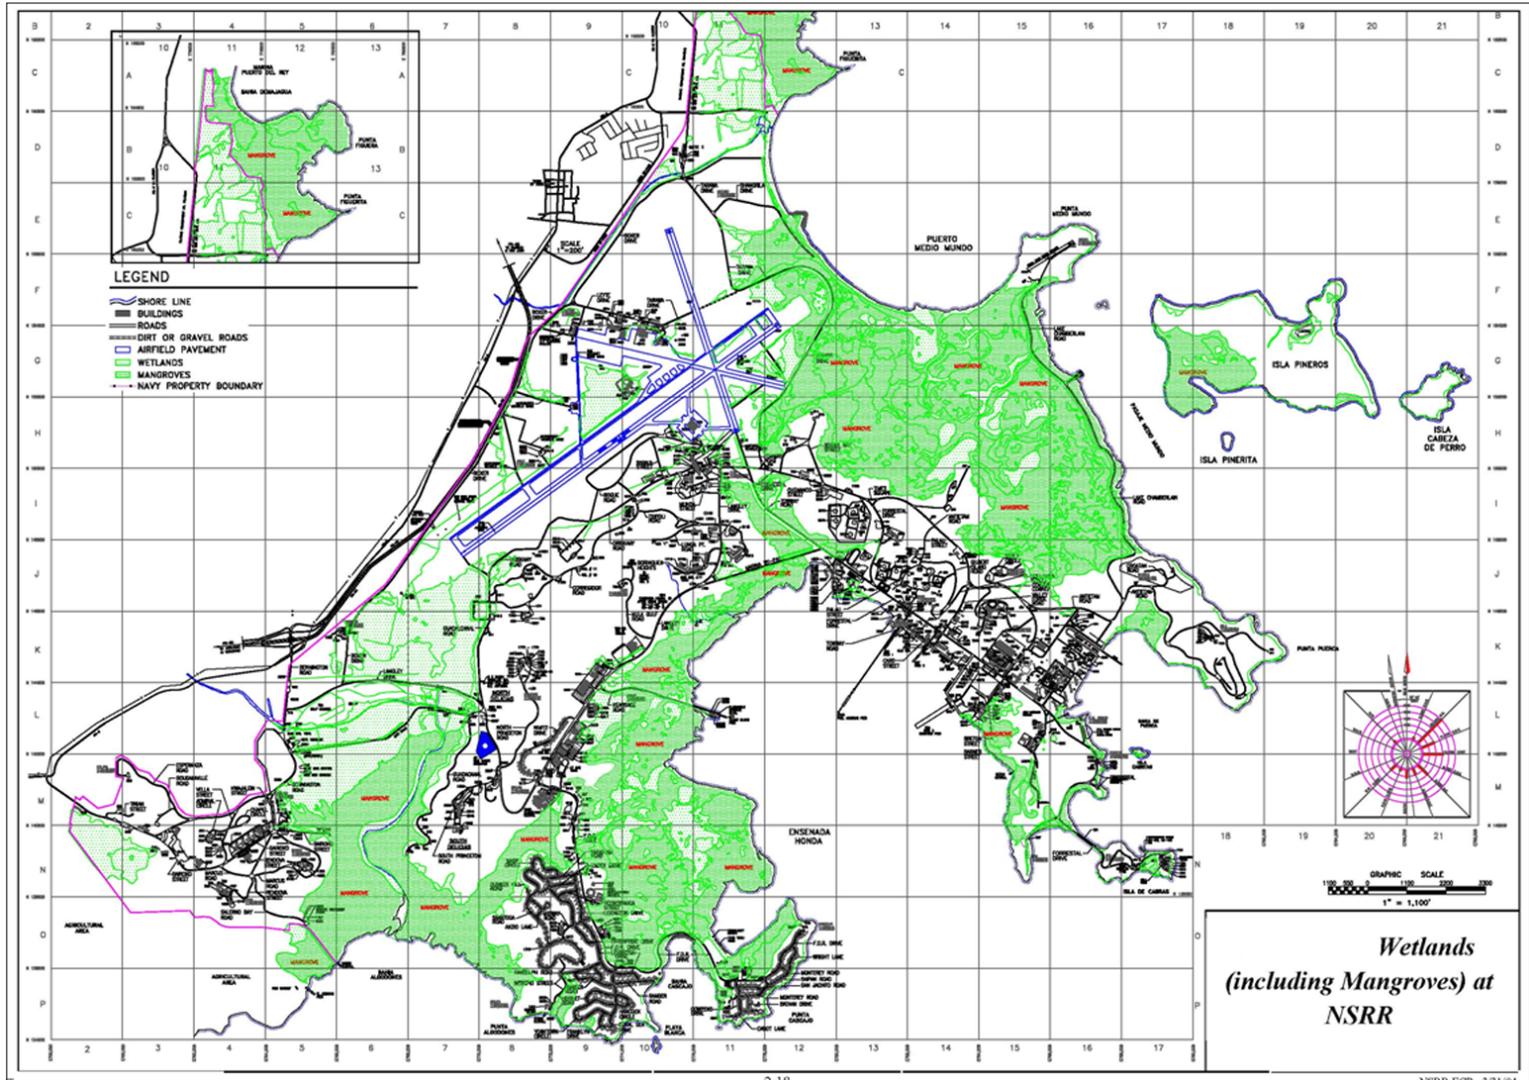

Figure III.1
Archaeologically Sensitive Areas at NSRR

Roosevelt Roads Reuse Plan

Figure III.2
Wetlands (including mangroves) at NSRR

Roosevelt Roads Reuse Plan

The industrial operations at NSRR are currently managed under various environmental programs, primarily the Resource Conservation and Recovery Act (RCRA) and the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). RCRA is a cradle to grave waste management program. The program identifies specific operations that are known to generate hazardous waste and those processes that generate, treat or store hazardous waste are identified as solid waste management units (SWMUs). Under RCRA, extensive monitoring and reporting are required for each SWMU from initial waste generation through treatment/management and finally disposal. RCRA is the same regulatory authority that regulates landfills, underground storage tanks (USTs), and above ground storage tanks (ASTs). CERCLA, also known as superfund, was established to identify those sites where environmental releases had already occurred or might occur and to take appropriate action to remedy those releases.

The RCRA program at NSRR developed as a consequence of the Navy's Installation Restoration Program (IRP). The Navy has developed their own environmental program that generally follows the CERCLA process to address environmental concerns at Navy installations. Under this program, the Navy managed the investigation and remediation of environmental issues identified at NSRR. The Navy used the IRP program to manage approximately 30 environmental sites at NSRR through 1993. In 1993 the Navy prepared and submitted a RCRA Part B permit to the Environmental Protection Agency (EPA) Region 2 for the entire NSRR facility to address their hazardous waste generation and storage issues. The permit identified fifty-four (54) solid waste management units (SWMUs) and four (4) Areas of Concern (AOCs) to be included as part of the operating permit. Figure III.3 identifies all of the SWMU and AOC locations in relation to the proposed redevelopment sub-zones.

The Navy submitted a revision to the original Part B permit, as a permit modification in March of 2004 to

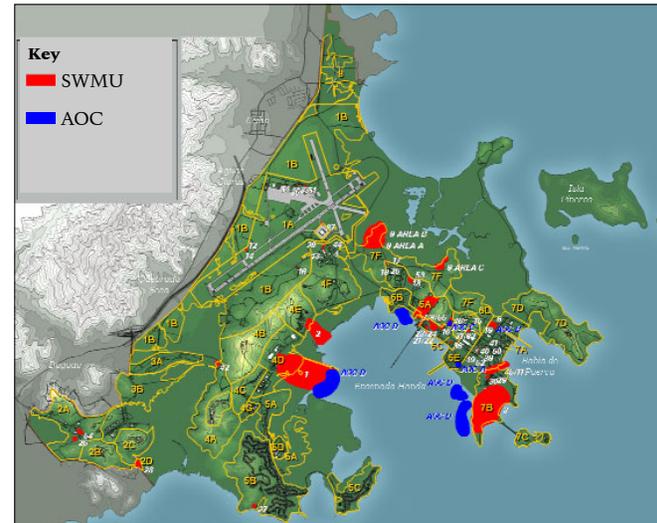

Figure III.3
Location of SWMUs and
AOCs at NSRR

request No Further Action (NFA) on a number of SWMUs that were identified in the 1993 permit. At this time, EPA required that an additional SWMU be added: SWMU 55—the trichloroethylene release associated with the Tow Way Fuel Farm.

The following twenty-three (23) SWMUs have been recommended by the Navy for Land Use controls as part of the proposed NFA under the revised Part B permit. Table III.1 identifies the areas that have a land use restriction proposed under the revised Part B permit, the proposed reuse of an area if there is a potential conflict with the proposed land use restrictions and the proposed reuse.

Roosevelt Roads Reuse Plan

Table III.1
Navy Proposed
Land-Use Restrictions

SWMU NUMBER	DESCRIPTION	RCRA PERMIT RESTRICTION ON RE-USE	IDENTIFIED SUBZONE	PROPOSED REUSE	POTENTIAL CONFLICT w/PROPOSED REUSE?	COMMENTS
SWMU 1	Former Cremator Disposal Site	Yes	4D	Mixed Use	Yes, Resolve commercial Reuse with industrial Reuse	Investigation still ongoing, no land use controls recommended as of March 2004
SWMU 2	Langley Drive Disposal Area	Yes	4E	Residential	Yes, no residential would be allowed in the former landfill area	Investigation still ongoing, no land use controls recommended as of March 2004
SWMU 3	Base Landfill	Yes	7B	Science Park, Conference Center	Yes, resolve commercial, intuitional use with industrial Reuse in this former landfill area	Investigation still ongoing, no land use controls recommended as of March 2004
SWMU 7/8	Tow Way Fuel Farm/Sludge Burial Pits	Yes	6A/6B	Fuel Farm and Water Oriented Commercial	Yes, resolve commercial Re-Use with industrial	Corrective Measures Ongoing, no land use controls recommended as of March 2004
SWMU 10	Transformer Maintenance Area/Building 90	Yes	6C	Water oriented commercial	No, only residential proposed for restrictions	NFA pending. PCB contaminated soils. Navy has requested a NFA with a land use restriction against residential Reuse
SWMU 14	Fire Training Pit Area	Possible	1A	Airport Re-Use	No, industrial Reuse appropriate as part of site remediation	Investigation not yet initiated, land use controls would depend upon the results of the investigation

Roosevelt Roads Reuse Plan

SWMU NUMBER	DESCRIPTION	RCRA PERMIT RESTRICTION ON RE-USE	IDENTIFIED SUBZONE	PROPOSED REUSE	POTENTIAL CONFLICT w/PROPOSED REUSE?	COMMENTS
SWMU 23	Oil Spill Separator Tanks	Yes	6C	Water oriented commercial	Yes, resolve commercial Reuse with proposed industrial Re-Use restrictions	NFA pending. Proposed for industrial Re-Use only due to elevated levels of petroleum hydrocarbons in the soils
SWMU 25	DRMO storage yard	Possible	6A	Industrial	No, industrial Reuse appropriate as part of site remediation	Investigation not yet initiated, land use controls would depend upon the results of the investigation
SWMU 27, 28, 29, 42	These are the on-site wastewater treatment plants (Capeheart, Bundy, Industrial Area, and Filter Backwash Lagoons)	Yes	5B, 2D, 7B, and 4A	Identified as treatment plants	No, will be maintained as WWTPs	May only be Reused as a waste water treatment plant
SWMU 30	Former Incinerator Area	Yes	7B	Science Park Conference Center	No, groundwater is not being proposed for use in the area	NFA pending. Navy has proposed restrictions on groundwater use
SWMU 31	Waste Oil Collection Building	Yes	6E	Cargo/ Passenger Ferry mixed commercial use	Potential conflict, remediation will need to address commercial use.	NFA Pending. Corrective Measures Implementation Plan is pending the approval of the Reuse Plan. Soils have dioxins, furans
SWMU 32	PWD Storage Yard/Battery collection Area	Yes	6E	Cargo/ Passenger Ferry mixed commercial use	Potential conflict, remediation will need to address commercial use	NFA Pending. Corrective Measures Implementation Plan is pending the approval of the Reuse Plan. Soils have dioxins, furans

Roosevelt Roads Reuse Plan

SWMU NUMBER	DESCRIPTION	RCRA PERMIT RESTRICTION ON RE-USE	IDENTIFIED SUBZONE	PROPOSED REUSE	POTENTIAL CONFLICT w/PROPOSED REUSE?	COMMENTS
SWMU 37	Waste Oil Storage/Building 200	Yes	1B	Industrial	No, proposed for industrial Reuse	NFA pending. PCBs, SVOCs in soils. Navy has requested a NFA with a land use restriction against residential Reuse
SWMU 38	Sanitary Storm Sewers	Yes	Site Wide	Mixed use	No	To be maintained as a sanitary sewer system
SWMU 39	Former Battery Drain Area	Yes	7A	Science Park	No, as long as no residential, or other housing is proposed for the area	NFA pending. Navy has requested a NFA with a land use restriction against residential Reuse. Arsenic in soils
SWMU 45	PCB spill area/old power plant	Yes	7A/7B	Science Park Conference Center	Potential conflict, remediation will need to address Reuse	Corrective Measures study ongoing, land use controls would depend upon the results of the corrective measures study. PCBs in soils
SWMU 51	New AIMD Storage Pad/Building 379	Yes	1A	Airport	No	Navy has requested a NFA with a land use restriction against residential Reuse. SVOCs in soils
SWMU 54	Former NEX repair maintenance site	Yes	2A	Government learning and training center, residential, Veterans Admin clinic	Potential conflict, remediation will need to address residential Reuse.	Corrective Measures study ongoing, land use controls would depend upon the results of the corrective measures study. TCE in groundwater
SWMU 55	TCE Plume in Tow Way Fuel Farm	Yes	6A, 6B	Industrial and water based recreation	Potential conflict, remediation will need to address commercial Reuse.	Investigation ongoing. TCE in groundwater not yet delineated.

Roosevelt Roads Reuse Plan

Where there is the potential for conflicts related to the reuse in a specific area, these will be addressed with the Navy and EPA prior to property transfer.

As part of the support operations, NSRR has an extensive UST/AST program. Currently, NSRR has thirty-seven (37) operational USTs, including nine (9) that are empty or out of service and seventy-seven (77) USTs that were removed prior to 1998. There are currently ninety (90) ASTs that are operational at NSRR and approximately thirteen (13) have been removed. However, the documentation of the ASTs is poor and others may be present. The bulk storage tanks located in the Tow Way fuel farm are also identified as USTs, but those tanks are regulated under the RCRA Part B permit as SWMU 7/8 rather than the UST program. The locations of the USTs are indicated in Figure III.4. The USTs closed to date have been under the authority of the Puerto Rico Environmental Quality Board (EQB) and no restrictions have been placed upon the reuse of property by EQB in any former tank location. However, there are still 37 operational tanks and there may be environmental issues associated with these UST locations. No information regarding releases was indicated for any of the existing tanks that remain active on NSRR.

There are currently twenty-nine (29) oil water separators (OWS) that are active at NSRR. OWS are not currently regulated under any program, although some have been included in the SWMU program (i.e.: SWMUs 12, 23, 24) due to a confirmed release. The ECP report indicates that all of the existing 29 OWS are sized to process waste water. However, all of the OWS are also tied into the stormwater system and eight (8) of the twenty-nine (29) are not sized appropriately to handle a 1-hour 5 year storm event (5 inches), four (4) have structural problems, three (3) have blocked drain lines, and three (3) are illegally discharging to the storm sewer rather than the sanitary sewer. None of the unregulated OWS have indications of a release. However, most are buried and an assessment of releases cannot be performed without a subsurface investigation.

The Navy performed an Environmental Condition of Property (ECP) survey once NSRR was identified for closure under BRAC. The ECP was performed to categorize the property into specific action categories depending upon the verification of a potential environmental release in any area. The ECP identified twenty-three (23) sites that may have had a release and that are not currently under the authority of a RCRA or a CERCLA program. The location of the ECP sites relative to the subzone locations is indicated on Figure III-5. The Navy prepared a workplan, the *Draft Phase II Environmental Condition of Property Workplan*, dated April 30, 2004, to investigate the twenty-three sites and the field work was performed in June and July of 2004. The Navy investigated twenty of the twenty three sites; two (2) sites: ECP site 1 and ECP site 22 were transferred to other federal agencies and those agencies may perform an investigation at a later date. Accordingly, these two sites are not part of the Reuse Plan. A final determination by the Navy on the remaining ECP site 23 will be made at a later time.

The results of the surface, subsurface, and groundwater investigation were provided in the *Draft Phase II Environmental Condition of Property Report Naval Activity Puerto Rico (Draft Phase II Report)* dated September 1, 2004. The results provided in the Draft Phase II report confirm releases at seventeen (17) of the twenty (20) ECP sites. As part of the Navy investigation, a qualitative risk assessment was performed using the analytical information obtained for each of the sites. The Navy used the analytical data obtained from the site investigation and compared this information to the EPA Region 3 risk based concentrations (RBCs), to assess the potential risk of each identified analyte to a human health or ecological risk standard. The EPA has two different risk standards depending upon the land reuse: industrial and residential. The industrial standard is a higher contaminant concentration as compared to the more conservative residential standard. The Navy applied the industrial risk concentration in all ECP investigation areas based upon the assumption

Roosevelt Roads Reuse Plan

that a similar industrial reuse would occur in areas where confirmed releases occurred. Using the Navy’s qualitative risk assessment, additional investigation is warranted at fourteen (14) sites. These sites are indicated in Figure III.5. Where the Navy applied the industrial risk screening criteria for a particular ECP site, the remedial action clean-up goal would be based upon the higher industrial RBC. The following table illustrates areas where the proposed reuse conflicts with the Navy’s assumptions.

Roosevelt Roads Reuse Plan

Figure III.5
Location of ECP Sites at
NSRR

Roosevelt Roads Reuse Plan

NSRR was the storage facility for the majority of munitions used in training at NSRR, Vieques and Culebra islands. Munitions and Explosives of Concern (MEC) were also investigated as part of the ECP report. Three small arms ranges were identified on site at NSRR and were investigated according to the Draft Phase II ECP Workplan. According to the ECP report, the Navy found no evidence of heavy (crew-served) weapon ranges on NSRR, any unexploded ordnance (UXO) impact areas, or evidence of open burning/open detonation activities. However, Isla Piñeros was known for EOD training exercises, although according to the ECP report, training exercises do not generally use live munitions, only smoke, flares, and small (5 pounds) of plastic explosives. Currently, access is restricted on Isla Piñeros as well as Cabeza de Perro due to concerns about potential MEC/UXO that may be present. The types of munitions stored in the munitions storage magazines included bombs, missiles, explosive projectiles (e.g. flares) small arms ammunition, and other types of MEC related items. The majority of the munitions storage areas are located south of Ofstie Airfield (subzone 1B). A magazine close-out inspection was conducted at NSRR by the Naval Ordnance Safety Security Activity (NOSSA) in February 2004. This inspection confirmed that all magazines were completely cleared of all ordnance-related items, and no explosive residuals or contaminants were present in the magazines.

Lastly, the Navy is currently assessing the facility for both lead based paint and asbestos containing materials in the existing buildings at NSRR. Eight hundred and seventy-nine (879) buildings were constructed prior to 1978; the year in which lead based paint (LBP) was banned from consumer use. These buildings and any other structures built before 1978 are presumed to contain LBP. A comprehensive survey has not been conducted at NSRR. However, a LBP inspection and risk assessment of family housing is being conducted by the Navy and those results are not yet available. In

March and April of 1990 the Navy performed asbestos containing material (ACM) survey of ninety (90) buildings and seventy-eight (78) of those ninety (90) buildings have identified ACM. Another study done of the Capeheart and Turnkey housing areas identified ACM in all the houses that were sampled. The Navy is currently conducting a site-wide asbestos survey, but the results are not yet available. Because the LBP and ACM assessments have not been completed as of the date of this Reuse Plan, additional environmental constraints may be identified as a result of the completed lead-based paint and asbestos survey results.

For the purposes of this report, no natural resource area, SWMU, AOC, UST/AST/OWS, ECP asbestos or lead-based paint location has been eliminated from consideration for development as many are still under investigation, remediation, or some form of institutional controls may be implemented to address most reuse scenarios.

Infrastructure

The Consulting Team was tasked with reviewing existing data on infrastructure at NSRR, and supplementing with field notes and photos during field trips to the site. The team collected existing reports, base maps, coastal charts, construction plans, and utility information to ascertain that the general infrastructure of the base is currently adequate to support the existing development on the base, and has the capacity to support additional development. The specifics of the surplus capacity were studied during the alternatives analyses and are presented in Chapter VII of this report. An earlier report, *Roosevelt Roads Reuse Plan: Site, Context and Market Conditions*, details specifics of the Base infrastructure, in addition to documenting environmental considerations and regional transportation system (see Appendix A). The most important aspects of the analysis are summarized as follows.

Roosevelt Roads Reuse Plan

- **Infrastructure:** NSRR is a fully functioning base, with adequate infrastructure systems to convey potable water, fire water and electric power to buildings and facilities. The systems have been developed and maintained in accordance with or above the standard of care.
- **Wastewater:** Base wastewater is treated and discharged and is fully permitted under a National Pollution Discharge Elimination System (“NPDES”) permit. With the decommissioning of the Base, it will be difficult to maintain the sanitary system. If any one of the three wastewater systems ceases to be operational, the NPDES permit will become invalid. Keeping the permit valid is of key importance, since applying for and obtaining new permits for wastewater treatment and discharge is a long and arduous process. The NSRR Public Works Department plans to “mothball” and maintain equipment for the next two years.
- **Drinking Water:** The Base receives its water from a pipeline from Rio Blanco in the El Yunque Mountains. The raw water is treated and distributed throughout the Base. Monitoring data for trihalomethanes (THMs) at the discharge of the treatment plant and at remote points on the water distribution system show that the addition of chlorine for disinfection at the plant is causing the formation of this organic chemical contaminant at unacceptable concentrations. THMs may be controlled by various techniques, including enhanced treatment process control, removal of the precursor organic chemicals, elimination of chlorine as the disinfecting agent or removal of the fully formed THMs by physical or chemical treatment. This should be evaluated further with regard to regulations governing Roosevelt Roads.
- **Building Maintenance:** Base maintenance for other systems is also important. The buildings will quickly succumb to mildew and rot if they are not provided with a minimum level of air conditioning. The Navy is, so far, meeting its obligation to maintain Base facilities at an acceptable level to facilitate building reuse.
- **Contamination:** An Area of Concern is an area identified for possible contamination. If confirmation of contamination is obtained, the area becomes a Solid Waste Management Unit. A process is currently in place for identifying and designating SWMUs and AOCs on the Base. It is the subject of a concurrent study being completed by the LRA. For the purposes of this report, AOC and SWMU locations are not necessarily eliminated from consideration for development, since they can be remediated.
- **Port Area:** The marine infrastructure of the Base consists of 6 piers, bulkheading, one drydock, and a landing ship tank (LST) ramp. The pier adjacent to the drydock is dilapidated and does not lend itself to remediation. The visible features of the drydock, those above the waterline, are in a state of disrepair. The remaining piers, bulkhead and LST ramp are or were recently operational, and have been maintained. The federal channel to Ensenada Honda is maintained to a depth of 40 ft Mean Sea Level (MSL). This is not considered a deepwater commercial port, which would be on the order of 50 ft below MSL.
- **Marina:** There is a 72-slip marina on Base that was constructed in the mid-1990s. Each ship service box provides potable water and 110 V power. Conduit has been placed for cable television but cables were never installed. The average depth at the seawall is approximately 6-8 feet. The facility is generally in good condition as it is relatively new.
- **Airport:** The airfield at Roosevelt Roads has several runways, the longest of which is 11,000 feet. Future development around the runway must respect hazard zones and noise zones. These are documented in Appendix A.

Existing Building Assessment

The Consulting Team assessed the existing facilities on the Base using data supplied by the Navy and on-site inspections during February 2004. One outcome of these studies and investigations was the realization that approximately 10% of the 1,600 facilities on the Base have not yet been mapped and documented to the same degree as the remaining 90%. That said, a number of conclusions can still be drawn regarding the existing facilities at Roosevelt Roads.

The facilities were built over the course of the past 65 years from the beginnings of the Base in the mid-1940s right up until the present. Approximately 75% of the buildings were built before the end of the 1960s. Most of the facilities at Roosevelt Roads have been adequately maintained over the years and are in good condition.

The Consulting Team performed on-site visual assessment of NSRR facilities during an extensive four-day inspection on February 24–27, 2004. Sources for this study included the Consulting Team review of the following reports and construction documents provided by the Navy.

- Navy’s NSRR Buildings and Structures 110503;
- NSRR Super Map;
- LawGibb Group NSRR Architectural Resources Inventory and Evaluation Study, June 8 2001;
- Various construction documents and information provided by the Navy’s on-site personnel.

Overview of Existing Facilities: There are over 1,600 listed facilities including buildings and other structures at Roosevelt Roads comprising more than 5,800,000 square feet (SF). Buildings range in size from the largest—the Public Works Building at 120,640 SF, to the smallest—a 64 SF utility building. The average building size is 3,600 SF.

Of the approximate 5,800,000 SF of listed facilities nearly 7%, or 399,069 SF, are deemed to be “Operationally Significant” and are essential to the on-going operation of NSRR’s existing infrastructure, its port and its airport. These include such facilities as the fuel pier, the main hangar at the airport, jet fuel tanks, the sewage treatment plants, etc.

Another 600,237 SF of listed facilities are “Unconfirmed” at this time with respect to condition, use or location resulting from inconsistencies or omissions from the reference data provided by NSRR. This will require additional time and research to resolve and is outside of the scope of this effort.

Net Square Footage Allocations: The Net Square Footage of built facilities totals 4,856,296 SF. This Net Square Footage derives from the total of approximately 5,800,000 SF and excludes those facilities identified as “Operationally Significant” (399,069SF) or “Unconfirmed” (600,237 SF).

In broad terms the general use of the facilities breaks down as follows:

- There are more than 801 residential buildings including single and small scale multi-family dwellings, apartment houses and a hotel. These buildings comprise 2,417,010 SF, or 50% of the net square footage.
- There are also facilities in use as commercial, retail, offices and industrial facilities. These approximate 1,225,000 SF in area, or 25% of the net square footage.
- Educational, institutional and public amenity purpose buildings comprise 370,000 SF or 8% of the net square footage; and
- Storage structures (both in permanent structures or metal buildings) comprise 541,621 SF and represent slightly more than 11% of the net square footage.

Roosevelt Roads Reuse Plan

- The remaining square footage serves municipal, utilitarian, military or open space recreational functions and comprises approximately 302,700 SF, or 6% of the total.

Table III.3
Tabular Summary
of Facility Square
Footages

Total Facilities	5,855,602 SF
<i>Less: Operationally Significant</i>	<i>-399,069 SF</i>
Subtotal	5,456,533 SF
<i>Less: Unconfirmed</i>	<i>-600,237 SF</i>
Facilities Net Square Footage	4,856,296 SF

Facility Type	Net Square Footages	Percent of Total
<i>Residential</i>	<i>2,417,010 SF</i>	<i>49.77%</i>
<i>Business</i>	<i>500,548 SF</i>	<i>10.31%</i>
<i>Industrial</i>	<i>459,293 SF</i>	<i>9.46%</i>
<i>Storage</i>	<i>434,998 SF</i>	<i>8.96%</i>
<i>Retail</i>	<i>189,543 SF</i>	<i>3.90%</i>
<i>Recreation</i>	<i>185,864 SF</i>	<i>3.83%</i>

<i>High Hazard</i>	<i>106,623 SF</i>	<i>2.20%</i>
<i>Utility</i>	<i>74,339 SF</i>	<i>1.53%</i>
<i>Municipal</i>	<i>21,395 SF</i>	<i>0.44%</i>
<i>Military</i>	<i>21,117 SF</i>	<i>0.43%</i>
Subtotal	4,856,296 SF	100%

Facilities Assessment: With a few exceptions, the prevailing condition of the existing facilities at NSRR is good. This may be attributable to the degree of maintenance provided over the years by a combination of Navy personnel and civilian employees.

There are a number of newly constructed facilities at NSRR that have just been completed but never occupied. These include a new office building and a new barracks for the Navy Seals. Another project just completed is the new BEQ (Bachelors and Enlisted Quarters) residential facility.

In addition, a number of facilities have been recently renovated. These include the Navy Exchange, the Hospital, the Commissary, and a number of single family residential buildings.

With consistency, most facilities at the Base were sited, designed and constructed for functionality and lack any sense of specific aesthetic quality or architectural style. Similarly, their access, siting and open space are absent any landscape design.

A number of buildings were scheduled for renovation or gutted in anticipation of an imminent renovation. They remain in that unusable condition.

Numerous buildings, particularly some of the older metal storage buildings, are obsolete or deteriorated and are candidates for removal.

Figure III.6
BEQ Apartments

Notes by Selected Facility Type

- **Residential:** Existing housing stock at NSRR includes 801 single and multi-family residential facilities comprising 2,417,010 SF.

Of those, 676 are single family dwellings comprising 1,233,185 SF, or 51% of the total residential building area. The majority of single family houses are small, concrete block structures with punched windows and low-sloped built-up roofs and range in size from 1,600 to 2,000 SF. Larger single family structures, typically allocated as officer's housing, are similar in style and approach 3,000 SF. Of the 676 single family dwellings, 319 have been recently renovated.

Another 98 buildings consist of small multi-family dwellings designed to accommodate 2 to 8 families. These comprise 474,000 SF, or 20% of the total residential area.

The remaining 29% of the residential area is made up of 27 Large Scale Multi-family or Lodging buildings, comprising 710,000 SF.

- **Operationally Significant:** Facilities in this category include those necessary for basic infrastructure and

utilities, airport operation and port usage. Excluding Pier 3, there are 113 Operationally Significant structures on the Base comprising 399,000 SF. This amounts to 7% of the total built area for the Base and about 7% of the total number of facilities.

- **High Value Facilities:** Buildings and structures in this category include those that are necessary to support utility or port infrastructure, offer a significant public amenity in their current location (e.g. hospital) or, in the case of residential buildings, have been recently renovated.

This category includes many small structures. Excluding facilities under 3,000 SF in area, there are a total of 116 High Value structures totaling 1,700,000 SF in area. This is approximately 29% of the 5,800,000 SF total built area on the Base.

In terms of size breakdown of the High Value facilities there are 933,000 SF in facilities over 25,000 SF, 335,000 SF in facilities between 10,000 SF and 25,000 SF in area and 401,000 SF in facilities between 3,000 SF and 10,000 SF in area.

Roosevelt Roads Reuse Plan

A small but significant number of facilities are considered essential for continued operation of the Base infrastructure, airport or seaport, such as the water filtration and sewage treatment plants. In addition, 29% of the remaining facilities are judged to be of potentially high economic value due to their unique characteristics. Taken together these figures total more than 500 facilities spread out over the entire Base. The cost of maintaining this large number of essential or economically valuable facilities will be significant.

The remaining facilities comprise more than 1,000 structures currently serving a myriad of uses by the Navy. Because their physical condition, quality of construction and location vary considerably, their future usefulness will depend largely on the specific re-use plans developed and implemented. Again, the sheer number of facilities falling into this category will make even minimal maintenance a costly endeavor. Serious

consideration will have to be given to demolition of facilities that are not either used or minimally maintained in the near future to limit the cost of stabilizing and securing such a vast number of structures.

In terms of reuse of the existing facilities, excluding specialized military facilities, approximately 98% of the Net Square Footage (NSF) on the Base could be used for civilian purposes. Approximately 60% of this square footage consists of Residential, Institutional and Recreational facilities. The remainder is comprised largely of Commercial and Industrial facilities including offices, stores, warehouses, workshops, etc. Many of these could be readily adapted to serve any number of uses depending on the final Reuse Plan adopted. However, neither the extent of the adaptation required for reuse of these facilities, nor the related costs have been determined as part of the Reuse Plan

IV. Market Analysis

The Consulting Team conducted an economic and real estate market overview in order to assess the market opportunities and constraints likely to be associated with the reuse of Roosevelt Roads. Uses considered in the market analysis included residential, research and development (science park), industrial, industrial port, cruise ship terminal, marinas, office, retail, lodging, conference center, ecotourism, and nautical tourism. The outcome of this overview is the identification of the types of land uses that are likely to be supported from a market perspective. The information in this chapter is summarized from background reports prepared in April and May 2004. Principal findings are summarized below.

Other than relatively high-end residential, there are no compelling market driven needs not currently being met in the region. Industrial and commercial space are in surplus; there are a number of new hotels and resorts being built or planned in the Eastern Region and the overall local economy has become somewhat depressed from the loss of jobs and spending previously generated by the Navy and the loss of its multiplier effect in the local economy.

Nevertheless, there are reuse opportunities that could be supportable in the near-term while others will require a longer-term perspective to find market acceptance.

Market findings indicate that supportable but limited near-term uses include:

- Residential
- Science park (research and development in the form of university sponsored research, educational programs, and private sector sponsored R&D)
- Industrial including distribution, warehouse and manufacturing
- Marina
- Cargo and Passenger Ferry Operation
- Moderate Lodging
- Ecotourism activities
- Airport (based on preliminary findings from an airport master planning initiative currently underway)

Roosevelt Roads Reuse Plan

In the longer-term, several additional uses could be supportable as demand grows and as the market acknowledges the success of early projects at Roosevelt Roads. These other uses could include

- ❑ Resort hotels
- ❑ Conference center (related to science park)
- ❑ Specialty retail/restaurants in a marina and tourist port setting
- ❑ Convenience retail (i.e. a grocery store-anchored neighborhood shopping center) to serve the needs of local residents living at Roosevelt Roads and in immediately surrounding neighborhoods
- ❑ Small cruise ships

Following this introduction, this chapter presents market findings and conclusions for each land use considered. It concludes with a discussion of school and medical facility needs that were also considered in formulating the Reuse Plan.

Residential

Current residential market conditions in the Ceiba/Naguabo Region¹ are depressed, with declining prices and increased vacancy, which are due primarily to the closure of Roosevelt Roads and the departure of associated military and civilian jobs. In the near term, Roosevelt Roads is not proximate to Puerto Rico's largest job centers, which will temper demand for housing. However, the Ceiba/Naguabo Region is projected to require 13,000 new housing units for the period 2000–2025 to keep up with population growth. Therefore, future demand for housing could be strong, especially as jobs are attracted to Roosevelt Roads over time.

The site attributes of Roosevelt Roads, including spectacular views and existing infrastructure including

schools, hospital, etc., as well as the future improvements in access to San Juan via new highway construction, could make the site an attractive location for both the primary and second-home markets, especially at the higher price range.

Owner-occupied housing dominates the Puerto Rico market with owner-occupied units representing 78% of the Ceiba/Naguabo inventory and 73% of all Puerto Rico housing. It was assumed that the demand for new housing will roughly follow the historical mix. The current supply of for-sale housing currently being marketed in Fajardo and Ceiba and at Palmas del Mar serve as one indicator of potential absorption, especially for the up-market residential product. Single family detached and attached townhouses/ condominiums were also surveyed.

- In Fajardo and Ceiba, units ranging in size from 1,077 sf to 2,338 sf are selling at \$137,000 to \$265,000 (\$91 to \$172 per square foot).
- At Palmas del Mar, prices range from \$250,000 to \$2.5 million with most in the \$250,000 to \$900,000 range.

At the low-end of the range (\$170,000), only approximately 10% of the households in Puerto Rico, 17% of the households in San Juan, and 7% of the households in the Ceiba/Naguabo region can afford a home of this price, assuming a five percent downpayment. At prices of \$265,000, only about 4% of the households in Puerto Rico, 8% of the households in San Juan, and 3% of the households in the Ceiba/Naguabo region can afford a home of this price, also assuming a five percent downpayment. These findings point out that only a small segment of the population is able to afford the type of new units that are being constructed in the Ceiba and Fajardo area, but that the percentages overall are sufficient to sustain marginal additions to the higher priced home market.

Roosevelt Roads Reuse Plan

Three approaches were considered to estimate future demand. Precise forecasts are difficult when looking at the long term (e.g., 20+ years). Market cycles can be very volatile.

- **Approach A:** As shown in Table IV.1, demand over the period 2005–2025 is projected by the Planning Board at 8,917 units (446/year) for the Ceiba/Naguabo region. Historically, the municipalities of Ceiba and Fajardo have captured 19% of the eight-municipality region. For the purpose of this analysis, future demand in Ceiba, Naguabo and Fajardo can be estimated at 20–25% of regional demand, or 89–112 units/year over 20 years. Most of the units (approximately 75%) will be for-sale.

- **Approach B:** Actual absorption at Palmas del Mar is currently at 140–150 new units/year, while new Ceiba and Fajardo developments are selling between 4 and 12 units/month=48–144 units/year. Note that Palmas del Mar has been under development for 30 years and its mix of primary and secondary housing is approximately 50/50.

- **Approach C:** This approach assumes that large-scale development at Roosevelt Roads could create a new, higher level of demand in this area that allows the Base to capture a higher proportion of the market than its market subarea has achieved historically. This might lead to absorption of more than 150 units/year.

REGION	2000–2005 ¹	2005–2010	2010–2015	2015–2020	2020–2025	TOTAL: 2000–2025
Puerto Rico						
<i>New Residents</i>	123,865	92,283	80,376	61,714	42,145	400,383
<i>Average Annual Growth</i>	0.6%	0.5%	0.4%	0.3%	0.2%	0.4%
<i>New Housing Units</i> ²	41,565	30,967	26,972	20,709	14,143	134,357
Ceiba/Naguabo Region³						
<i>New Residents</i>	11,534	9,208	7,427	5,922	4,017	38,108
<i>Average Annual Growth</i>	0.8%	0.6%	0.5%	0.4%	0.3%	0.5%
<i>New Housing Units</i> ²	3,870	3,090	2,492	1,987	1,348	12,788
San Juan Region⁴						
<i>New Residents</i>	18,189	7,540	11,368	6,758	6,004	49,859
<i>Average Annual Growth</i>	0.3%	0.1%	0.2%	0.1%	0.1%	0.2%
<i>New Housing Units</i> ²	6,104	2,530	3,815	2,268	2,015	16,731

There is a good opportunity to make Roosevelt Roads a desirable residential location in Puerto Rico, building on the site's location, water frontage and excellent views. Proximity to jobs will be important, so developing professional employment opportunities (such as a science park) would strengthen the market attractiveness of high quality residential uses.

All things considered, a prudent estimate for residential demand would indicate that if an overall high quality appearance at Roosevelt Roads is established and maintained, it has the potential to support on the order of 150–250 units/year of combined primary and secondary residential units.

Science Park

Puerto Rico's economic development strategy includes a growing emphasis on a knowledge-based economy, echoing similar strategies successfully pursued in other relatively small island settings, including Ireland and Singapore.

Some of this emphasis has born fruit, with recent engineering and development initiatives from the private sector (e.g., Pratt & Whitney in aircraft engineering, HP in product development, and medical device manufacturers adding product improvement/development activities to their production functions). Puerto Rico has attracted a significant group of companies, each prominent in its own dynamic sector of the economy. Companies in pharmaceuticals and biotechnology, medical instruments, and electronics are located throughout the island, as shown in Table IV.2 below.

While a science park may be seen as more aspirational than tangible, the strong and growing investments by pharmaceutical and other companies point to at least the possibility that some additional product development activities can eventually be housed in Puerto Rico, especially if a special environment is created to attract them.

Earlier this year, the Commonwealth Government established the Puerto Rico Science, Technology & Research Trust. With funding of \$100 million, the Trust will set public policy for science and technology research and development with an initial focus on life sciences and information technology. The Trust may

invest in basic and applied research, education and training, technology commercialization and services, attraction of world-class scientists, and the construction of technology parks. The Trust will operate primarily through alliances between business, government and academia.

Roosevelt Roads has many of the attributes necessary for a science park and the possibility of developing a site with the special physical characteristics of Roosevelt Roads makes the potential for accelerated market demand worth considering.

Roosevelt Roads Reuse Plan

A science park is defined as “an organization managed by specialized professionals, whose main aim is to increase the wealth of its community by promoting the culture of innovation and the competitiveness of its associated businesses and knowledge-based institutions. To enable these goals to be met, a Science Park stimulates and manages the flow of knowledge and technology amongst universities, R&D institutions, companies, and markets; it facilitates the creation and growth of innovation-based companies through incubation and spin-off processes; and provides other value-added services.”² A science park may include private sector users and/or an affiliation with a university or other public sector users (e.g., governmental laboratories).

Roosevelt Roads begins to satisfy many of the criteria that a successful science park will need, but Puerto Rico will have to initiate an aggressive program to market itself and solicit interest among prospective users to bring this use to fruition. There are several key attributes that characterize successful science parks:

- *Affiliation/close proximity to a medical center, major research university, research clinics, laboratories, or major company bearing recognition as a leader in one or more scientific fields relevant to the park’s planned orientation.* The Roosevelt Roads site currently lacks the desired affiliation but there have been several expressions of interest by universities and federal agencies, suggesting that the desired connection might be achievable. There has been interest expressed by both the University of Puerto Rico and the Polytechnic University of Puerto Rico in locating select research and development efforts on the site. If one of the universities were to serve as an anchor for this type of development, the ability to attract additional public and private sector tenants would be greatly enhanced. In addition, the National Oceanographic and Atmospheric Administration has expressed a tangible interest in establishing a Caribbean Marine Science, Biotechnology and Aquaculture Center.
- *Convenient transportation access to desirable residential communities or neighborhoods where researchers are likely to reside.* Access is acceptable but improved housing choices in close proximity are needed. Redevelopment of the residential portion of Roosevelt Roads would help fulfill this criterion.
- *Sufficiently large site to accommodate a range of uses, including academic research laboratories including wet lab space, space for start-up firms (incubator space), and established successful firms.* The site meets this criterion.
- *An attractive “lifestyle” environment that provides landscaped open space and recreational facilities.* The site currently lacks this type of environment, but many of the improvements envisioned for the site are intended to overcome this void.
- *The presence of a high-quality human resources pool, generally provided by local industry and universities.* While the site will not be able to compete directly with science parks located near the major mainland universities with stellar reputations for faculty, programs and students, it can draw upon the best faculty and students in Puerto Rico and, potentially, from a broader Latin American regional population. For example, the University of Puerto Rico Mayaguez campus has an extensive engineering curriculum and awards as many engineering Bachelors Degrees as do the University of Wisconsin, Madison and the University of California at San Diego (see Table IV.4 on following page). While this criterion will present a challenge, it is being addressed by INDUNIV, the non-profit industry-university research consortium, which has already generated interest among prospective users. Successful centers globally (Silicon Valley, Boston, Research Triangle, Sophia Antipolis in France, etc.) are all characterized by having attracted talent from well beyond their regions and their countries. US immigration laws and visa restrictions may impede Puerto Rico’s progress in this regard,

depending on the national policies that are in place in the years ahead.

- *Presence of a strong business infrastructure, such as lawyers, accountants, venture capitalists, and suppliers with technology and intellectual capital-related expertise.* Such a presence does not exist to the extent found at some of the most successful science parks in locations like the San Francisco Bay Area, Boston, and Washington DC/Baltimore.
- *Provision of regional transportation access, including air access, both for transporting personnel and for transporting highly valued cargo; excellent highway access is important for connecting to nearby major cities.* The site satisfies this criterion. The presence of an airport should add to its attractiveness for some users.
- *Protection of Intellectual Property.* Puerto Rico satisfies this requirement.

Considering initial expressions of interest from a number of prospective users including universities, NOAA and the FDA, an initial increment of 50,000 to 100,000 square feet might be anticipated in the initial development phase, with annual absorption of a comparable amount in the years beyond.

Roosevelt Roads Reuse Plan

Industrial

The industrial market in Puerto Rico is characterized primarily by owner-occupied manufacturing facilities (including, in particular, pharmaceuticals) and for-lease properties owned by Puerto Rico Industrial Development Company (“PRIDCO”). PRIDCO estimates that it owns approximately 88 percent of the total industrial space available for lease in Puerto Rico. As of April 1, 2004, PRIDCO owned approximately 24.8 million square feet of industrial buildings. Of this total, approximately 75 percent was leased. Of the 25 percent of inventory that was vacant, 23 percent was reserved for prospective tenants and 17 percent was under negotiation. Historical construction of PRIDCO-owned industrial facilities is detailed in the following table.

Table IV.5
Historical Construction
of PRIDCO-Owned
Industrial
Facilities Completed
for Fiscal Years Ended
June 30

Sources: PRIDCO

YEAR	SQUARE FEET
1998	276,696
1999	336,826
2000	144,698
2001	240,228
2002	133,693
Total	1,132,141

As detailed in Table IV.5, PRIDCO constructed on average just over 225,000 square feet of new industrial space per year between 1998 and 2002. During this five-year period, the overall supply of industrial space owned by PRIDCO increased by the modest amount of approximately 4.7 percent. Anticipated construction of future industrial facilities by PRIDCO is detailed in the following table.

YEAR	SQUARE FEET
2003	505,000
2004	563,000
2003	428,000
2005	447,000
2007	467,000
Total	2,410,000

Table IV.6
Projected Construction of
Industrial Facilities to be
Completed during Fiscal
Years ending June 30.

Sources: PRIDCO

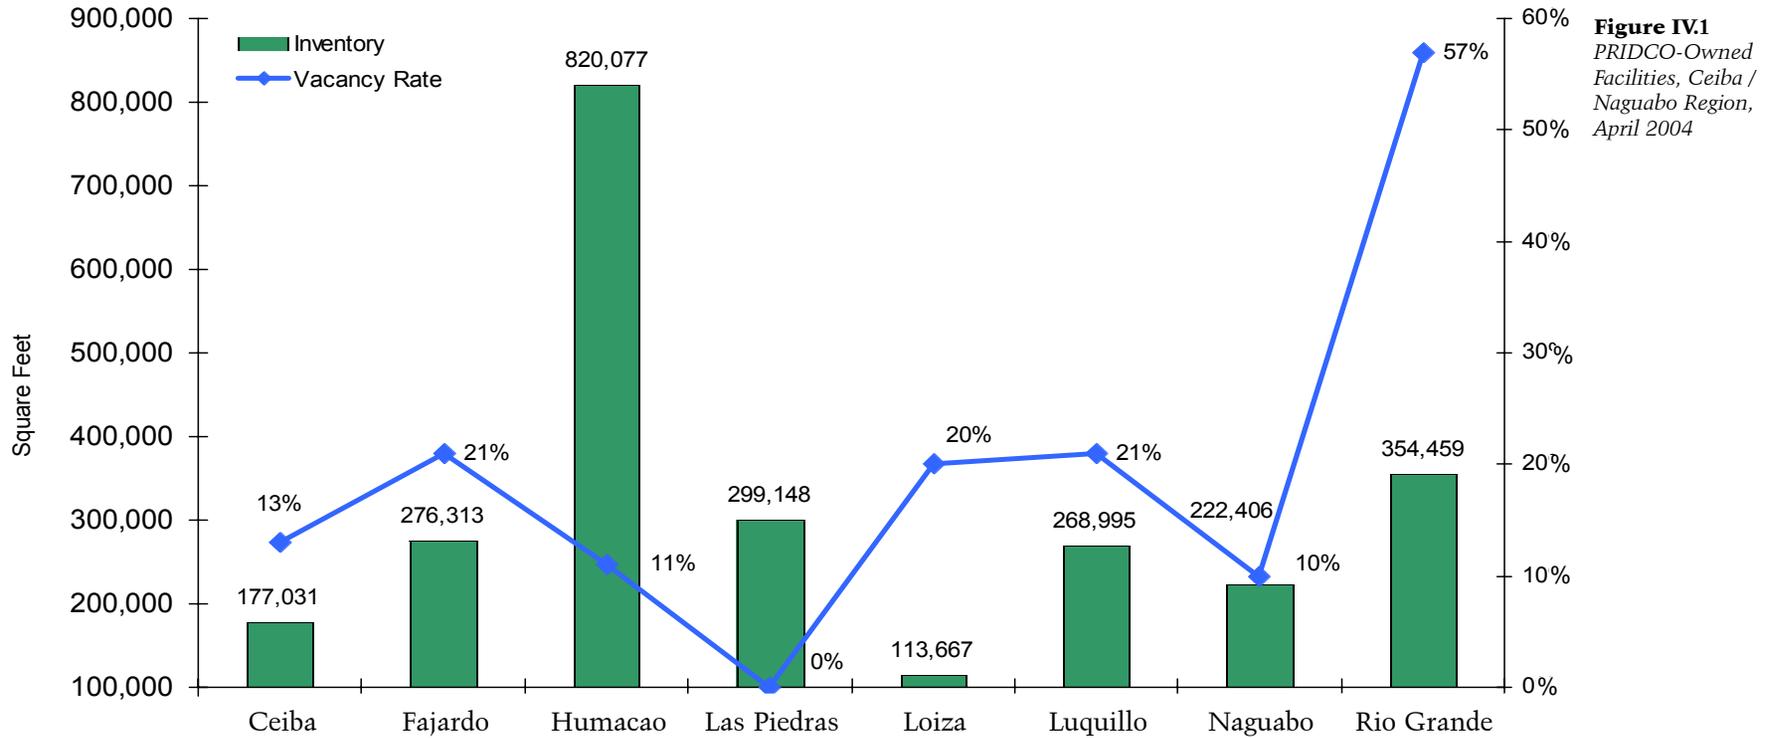

As detailed in Table IV.6, as of March 31, 2003, PRIDCO projected that it would construct a total of just over 2.4 million square feet of industrial space between 2003 and 2007, or an average of 482,000 square feet per year. During this five-year period, it is projected that PRIDCO’s overall inventory will increase by approximately 9.5 percent, double that which was experienced between 1998 and 2002.

Historically, PRIDCO constructed general-purpose buildings in advance of demand and special industrial buildings on demand. For several years prior to fiscal year 2003, PRIDCO did not construct general-purpose buildings in advance of demand but began to do so again in that fiscal year. As a result, four new projects and four remodeling projects were under development in 2003. These circumstances account for the difference between the average construction per year that occurred between 1998 and 2002 and the construction that is projected to occur between 2003 and 2007.

Potential demand for industrial development at Roosevelt Roads appears to be somewhat limited based on the current supply of general-purpose industrial buildings in the Ceiba/Naguabo Region and the corresponding vacancy rate in the Region. There is an overall

Roosevelt Roads Reuse Plan

inventory of some 450,000 square feet of PRIDCO industrial buildings there and an 18% vacancy rate (see Figure IV.1). However, it should be noted that much of the PRIDCO space was built decades ago and does not meet the needs and expectations of today's industrial user. Accordingly, newly designed product might gain further acceptance, even if it competes somewhat for the existing space users who are occupying less desirable space.

Looking ahead, Roosevelt Roads could have an advantage if the Base airport can attract air freight carriers, as much of Puerto Rico's exports are high value and shipped by air (e.g., pharmaceuticals, medical devices). Accordingly, industrial and distribution space at the site could enjoy a special advantage of proximity and, with that, the capability to meet just-in-time air freight schedules. Roosevelt Roads may also have the potential to attract industrial owner-occupiers, such as pharmaceutical and high technology manufacturers, who already have successful operations in Puerto Rico.

Roosevelt Roads Reuse Plan

The industrial and logistics (warehouse and distribution) opportunities are an extension of PRIDCO's target industries, potentially augmented over time by the proposed development of the Port of the Americas. Analysis of the success and continuing re-investment of the pharma industry indicates several factors that may be applied to target other companies as well. These include:

- Favorable tax treatment (essentially exempting income from national taxation as long as profits are not repatriated) generating cash flow for corporate development in markets other than the US;
- Security of assets and protection of intellectual property through US legal structure and political stability;
- Relatively high productivity from capital intensive plant/equipment investment (documented by CBRE Consulting-PRIDCO surveys of capital intensive manufacturers); and
- Appropriateness of airfreight due to high value per ton of products shipped (e.g., pharma, ink jets, medical devices).

Accordingly, the industrial targets for Roosevelt Roads would include those that PRIDCO and Port of the Americas will target, with a premium on those that might especially value airfreight proximity. These targets include:

- Pharma
- Medical
- Scientific instruments
- High value food & beverage
- Cosmetics
- Value added logistics & repackaging

Previous surveys of air cargo requirements in Puerto Rico have pointed to the potential to meet this demand through improved service at the Western end of the island, i.e. clients in Barceloneta and other cities to the west, including several pharmas and HP. Given the potential need to free up capacity in San Juan and the eventual opening of the Port of the Americas in Ponce, a conceptual case can be made for material inflow through Ponce and air freight out through the East as well as the West, thereby spreading the manufacturing activity and related employment more broadly on the island. Data for this concept will no doubt be more rigorously explored as part of the Airport Master Planning study currently underway.

In addition, Puerto Rico has recently been named as a helicopter maintenance center for a major aerospace company. Since Roosevelt Roads can also offer an 11,000-foot runway, serviceable buildings and available land as well as a workforce that is wage competitive, at least compared to other places that are FAA certifiable, there may also be potential for additional aircraft related services and production. This represents a significant opportunity if companies come to believe that the supply of skilled labor can be sustained. The track record for carefulness in the workplace for the pharma/medical industries points to a cultural strength that may also be marketable. Since documenting as well as doing the job right is a critical component of FAA regulated air craft maintenance, companies should be impressed by Puerto Rico's track record in the similarly highly regulated pharma industry (FDA documentation as well as careful productivity) and Puerto Rico's relative cost advantage compared to other certifiable locales. The capability to barge in aircraft, etc. is also attractive.

Based on the above, we estimate that Roosevelt Roads could capture some 1,000,000 square feet of industrial space during the first ten years of development.

Waterfront Uses

Several waterfront uses were considered including marina, ferry terminal, and large cruise ship terminal. Each is discussed below.

Marina For Recreational Boats and Small Cruise Ships:

There appears to be good potential for a marina at Roosevelt Roads given its location within the Ceiba/Naguabo Region, where many of Puerto Rico's marinas are concentrated, as well as its proximity to Vieques and Culebra. However, the marina slip inventory in the eastern region could be increasing significantly in the coming years if proposed expansion plans at various marinas are executed, which could temper demand at Roosevelt Roads.

There are currently 3,600 wet slips and dry stacks in the region and current plans call for an increase of nearly 1,000 slips (27%). The Roosevelt Roads Marina includes 72 slips and 25 moorings and is generally in good condition. There is ample room for expansion and, based on the other planned expansions, there appears to be a market for this use.

Consideration was also given to the feasibility of accommodating small cruise ships in the harbor at Roosevelt Roads. Small cruise ships generally carry 100 to 200 passengers on vessels of from 200 to 400 feet in length. Three cruise ship companies—Windstar, Seabourn, and Sea Dream—currently serve Puerto Rico, calling on San Juan and Culebra. Ports-of-call are selected based on their appeal to the high-end customers who generate the majority of the demand for these lines. They are looking for beautiful natural settings, unique shopping and dining opportunities, and a choice among many attractions for daytime excursions.

Because Roosevelt Roads currently lacks the features desired by the cruise operators, small cruise ships would not likely be supportable in the near-term.

However, once significant redevelopment of the Base occurs, including development of such amenities as hotel/conference center, golf course, specialty retail shops and restaurants, and an expanded and upgraded marina, small cruise ships could be attracted to the site.

Marina For Nautical Tourism: Small cruise ships, charter boats and private yachts characterize nautical tourism in the Caribbean. A recent study by Dornbusch Associates³, prepared for the Puerto Rico Tourism Company, assessed opportunities for nautical tourism development in Puerto Rico and focused on charter boats and mega yachts (i.e. larger than 80 feet). It found that little nautical tourism activity exists in Puerto Rico and that there are no charter fleets and very few mega yachts based on the island. The essence of Dornbusch's conclusions is summarized below:

- Nautical tourism does not develop without tax incentives and is severely restricted by excise taxes in Puerto Rico.
- Puerto Rico's competitive advantages to potential charter companies and mega yacht owners include access to Culebra and Vieques, the relatively inexpensive cost of fuel, and a well-developed infrastructure of services and facilities that is attractive to yachters, such as an international airport, luxury hotels, and upscale restaurants and shops.
- There are several large obstacles to developing nautical tourism in Puerto Rico, including the excise tax, lack of development incentives, and excellent attractions and facilities elsewhere in the Caribbean that have a head start in serving this market.
- None of the existing marinas in Puerto Rico would be able to attract the critical mass of mega yachts necessary to successfully compete in the regional market. San Juan is recommended as a preferred location for such a marina.

(3) Dornbusch Associates, "Incentive Program to Promote & Regulate Nautical Tourism in Puerto Rico," October 6, 2003.

Roosevelt Roads Reuse Plan

Based on the findings from the Dornbusch study, a marina for nautical tourism could be supportable at Roosevelt Roads if existing taxes are reduced and/or eliminated, other incentives are put in place, and other amenities and attractions are developed.

Ferry Terminal: Passenger and cargo ferry service between Puerto Rico and the islands of Vieques and Culebra is currently provided via a terminal located in nearby Fajardo. Approximately 854,000 passengers and 224,500 short tons of cargo moved through the Fajardo Ferry in fiscal year 2002–2003, the last year for which data is available.

The Puerto Rico Ports Authority has expressed its interest in relocating the Fajardo ferry operation to the harbor at Roosevelt Roads. Doing so would reduce travel time from Puerto Rico to Vieques by 50 minutes (Fajardo to Vieques, 80 minutes versus NSRR to Vieques, 30 minutes), reduce operating costs, and provide a solution to the currently congested conditions surrounding the existing terminal in Fajardo. A well-designed ferry terminal, with sufficient parking, convenient access, and a high standard of operation and

maintenance, would be a very appropriate use at Roosevelt Roads.

Large Cruise Ship Terminal: Due to Puerto Rico's location within the Eastern Caribbean, most cruise ships that make port of call stops in San Juan do so for only a partial day, often in the afternoon and evening. As a result, San Juan is an attractive destination because passengers can enjoy city activities during their brief time on the island. Interviews with planning executives at two major cruise lines indicate that there is not sufficient demand at this time for a cruise ship terminal at Roosevelt Roads because of the site's disadvantageous location from an itinerary planning perspective.

Lodging

The lodging market in Puerto Rico has been growing throughout the past ten years, as evidenced by the steady growth in the inventory of hotel rooms on the island. There were a total of 12,768 rooms in Puerto Rico as of June 30, 2002 (see Table IV.7).

	1993	1994	1995	1996	1997	1998	1999	2000	2001	2002

Table IV.7
Hotel Room Inventory,
Puerto Rico, 1993–2002

Notes:
1) As of June 30 each year
2) Includes establishments endorsed by the Puerto Rico Tourism Company only.

Roosevelt Roads Reuse Plan

The inventory of hotel rooms was split about evenly between metropolitan area hotels and non-metropolitan area hotels⁴. The island-wide inventory of hotel rooms has been growing steadily during the past ten years, experiencing a compound annual growth rate of 4.1 percent during the 1993–2002 period, which equates to an average addition of 465 rooms to the total inventory per year.

Consistent with Puerto Rico's dependence on visitors from the United States, the boom years of the United States economy provoked increased levels of occupancy. Specifically, during the 1993 to 2002 period, the average annual occupancy rate ranged from 63 percent to 72 percent. These levels are 5 to 10% over the occupancy levels achieved by the tourism industry on the mainland. The events of September 11, 2001 had a devastating effect on the worldwide tourism industry, and Puerto Rico was not spared. Nonetheless, by the beginning of 2003 Puerto Rico had been able to recover its occupancy rates to year 2000 levels.

Despite the United States' lagging economy, the last two years have been particularly strong in Puerto Rico. Specifically, in a world-wide study conducted by Deloitte for 2003, Puerto Rico ranked number 4 in occupancy in comparison to over 300 other world destinations. This is a marked improvement to prior rankings which had Puerto Rico ranked 52nd and 51st in the years 2001 and 2002, respectively.

The year 2004 has been a banner year for the Puerto Rico tourism industry. Occupancy levels have reached an average of 69% island-wide, an increase of 4 percentage points over year 2003 and 7 percentage points over 2002, and total visitors and visitors' expenditures increased 1% and 7.6%, respectively, reaching over 4.4 million visitors and over \$2.6 billion in expenditures, both record numbers. These results are encouraging when you consider that total

available rooms for Puerto Rico have increased over 3% from 2003. Project development pipeline has over 65 hotel projects in various stages of planning, development, and construction. During 2004, Puerto Rico will increase the hotel room inventory by about 10% or about 1,400 new hotel rooms, historically the highest gross increase in new room inventory for Puerto Rico.

The Ceiba/Naguabo Region is known for its access to activities and amenities such as El Yunque, the sister islands of Vieques and Culebra, and water sport activities and golf, and is anticipated to experience increasing demand in the lodging market. Such demand could be captured by a potential lodging development at Roosevelt Roads, which could capitalize on the beauty of the site, its proximity to Vieques, and Culebra, and complementary land uses (such as a marina and a golf course) that could be accommodated nearby.

Several high-end hotels are located nearby: Wyndham El Conquistador and its Las Casitas Village; Westin Rio Mar; and Paradisus Sol Melia. Under construction or planned properties include: Intercontinental Cayo Largo Resort; another phase of Las Casitas; Fairmont Resort; Mandarin Oriental; Four Seasons and J.W. Marriott. Because the market will need time to absorb this new capacity and reach stabilized occupancy, it is expected that resort hotels will be a longer-term opportunity at Roosevelt Roads. But given its amenities (and if further attractions are created, e.g., golf, expanded marina), Roosevelt Roads could be a very strong competitor in the high-end market.

Local community residents have also pointed to the potential for more moderately priced lodging, perhaps reusing former military housing facilities, and/or the existing Navy Lodge. Given Puerto Rico's overall substantial population and frequent visits by friends and family from the continental U.S., there may be ample

4. Metropolitan area comprises San Juan's urban areas as classified by the Puerto Rico Planning Board, including the municipalities of San Juan, Bayamon, Guaynabo, Catano, Trujillo Alto, and Carolina. Non-metropolitan area includes urban and rural areas other than the San Juan Metropolitan Area.

Roosevelt Roads Reuse Plan

opportunity to support moderate priced lodging in the nearer term. The Puerto Rico Tourism Company reports that during the 10-year period ending 2002, total room inventory in paradors nearly doubled, climbing from 656 rooms in 1993 to 1,061 rooms in 2002. These moderately priced lodging facilities accounted for about 16 percent of total rooms in non-metropolitan Puerto Rico as of 2002, and experienced an average occupancy rate of 46 percent.

Conference Center

Especially when considered in conjunction with the science park, Roosevelt Roads should be able to meet the criteria for success for an executive conference center:

- ❑ Within an hour of a major airport (i.e., San Juan)
- ❑ Near a major metropolitan area
- ❑ Good year-round weather
- ❑ Nearby attractions

The experience of the major hotels in the area indicate a large proportion of their bookings (as much as 50%) are for business groups, indicating that a conference center that focused on this market exclusively would be well positioned for those meetings which are not intended to include social or spouse/family involvement.

Retail

The majority of shopping centers in Puerto Rico are on major thoroughfares or expressways with good visibility and direct access. Developers and retailers insist on these characteristics for community or larger shopping centers, like those found in the San Juan region and at Plaza Fajardo in Fajardo. For the most part, NSRR does not satisfy the criteria for this use because of its location off the highway. Similarly, big box retailers are not

likely to be attracted to existing buildings at Roosevelt Roads, since they too demand highway visibility and good access.

Notwithstanding these conditions, there is one parcel in the airport area, at the southern end of the runway and bordering the highway that might someday prove appropriate for retail development. However, judgment regarding the compatibility of this use must be deferred pending the outcome of the airport master planning effort.

The site does have characteristics that could support other types of retail development. There will be potential for a grocery-anchored neighborhood shopping center supported by local residents currently living in the area and future residents at Roosevelt Roads, once there are a significant number of occupied homes on the site. Additionally, specialty retail, adjacent to the water, could also be supportable if it is developed with the appropriate mix of adjacent uses (e.g., residential, marina, lodging, and tourist-oriented facilities).

Ecotourism

Roosevelt Roads has several attributes that support the potential for ecotourism on the site, including existing mangroves that may be explored by hiking and/or kayaking excursions, canoeing and other forms of boating that may be launched from the existing marina on the site, and ecotourism-oriented visits that could be organized to the islands off the northeast coast of Puerto Rico, such as Vieques and Culebra. Given its location, proximity to other ecotourism experiences at El Yunque and its coastal setting, Roosevelt Roads could be well positioned to cater to this growing tourism sector. Consider:

- A 1990s survey by Bruskin Goldring found that 48% of vacationers planned to participate in nature-based activities during their trip.

Roosevelt Roads Reuse Plan

- A recent survey by Recreation Roundtable found that nearly 60% of Americans participate in outdoor recreation at least monthly.

Note that the designation, preservation and utilization of the environmentally sensitive areas on the Base would reinforce the market appeal for both the residential and science park reuses.

Transshipment Port

A container terminal was considered during the initial review of potential uses for Naval Station Roosevelt Roads. The presence of Ensenada Honda, a large naturally protected harbor with a 40-foot deep navigation channel, suggested that such a use should be evaluated. The LRA's approach was to first assess the Base's suitability for a container terminal before attempting to conduct any detailed demand analysis. Factors considered included: the site's physical conditions and the ability of the harbor front area to physically accommodate a container terminal; environmental issues; road access; cost; and compatibility with other uses under consideration for NSRR.

The LRA determined that a transshipment port is not feasible at NSRR. Support for that conclusion is summarized below. A more detailed evaluation of the concept from an engineering and cost perspective appears in Appendix B.

- There is not sufficient land area to support a facility that could accommodate Post-Panamax vessels. A backland area of approximately 172 acres would be needed for container storage. However, the existing land area north of the existing bulkhead is only 26 acres. Creating a backland area of sufficient size would require either extensive excavation of the existing hillside, or a major fill operation to reclaim a portion of the harbor. Reclamation would have a significant environmental impact, as it would cover existing bay bottom.

- The existing channel (40 feet deep and 1,000 feet wide) would have to be dredged to a depth of 50 feet, both within the harbor and over a length of approximately 12 miles outside the harbor in that location where water is shallower than 50 feet.
- Developing a transshipment port by excavating the hillside would require dredging of approximately 20.4 million cubic meters of material (this does not include side slopes and pay overdepth which could add up to 20% additional material), excavation of approximately 5.8 million cubic meters of material from land and fill of approximately 243,000 cubic meters of material. Assuming site material is reusable as fill, this would result in total off site disposal of approximately 26 million cubic meters of material.
- Alternatively, developing a transshipment port by filling a portion of the harbor would require dredging of approximately 17.4 million cubic meters of material (this does not include side slopes and pay overdepth which could add up to 20% additional material), excavation of approximately 580,000 cubic meters of material from land and fill at wharf face of approximately 10 million cubic meters of material. Assuming site material is reusable as fill, this would result in total off site disposal of approximately 8.2 million cubic meters of material.
- The cost associated with these alternatives for land development, dredging, paving, utilities and terminal equipment is estimated at \$850 million to \$1.1 billion. These costs do not include soil stabilization, building demolition and other considerable factors that could increase the total substantially.
- Dredging of the channel would disturb coral beds in the harbor and along the 12-mile channel, raising further environmental impact concerns.
- There are existing roads on the Base providing access

Roosevelt Roads Reuse Plan

to the harbor. An analysis of potential port generated truck traffic would need to be undertaken to determine impacts on adjacent properties. At a minimum, it is likely that a dedicated road would be required within the port area to separate port traffic from non-port traffic traveling to and from adjacent zones on the Base (i.e. Zones 6 and 7). The impact of port-related truck traffic on the community of Ceiba would also be an issue.

- Finally, a transshipment port would be incompatible with many of the other uses considered by the LRA and found to be desirable. Such uses include residential neighborhoods, a science park oriented toward research and development activity, a marina with related recreational and commercial uses, and a conference center. Close proximity to a major transshipment port would be detrimental to the viability of all of these uses. A port would also be incompatible with the uses proposed by the citizens of Ceiba and Naguabo.

For all of these reasons, the LRA concluded that a transshipment port is unsupported as a reuse at NSRR.

Office

Office space in Puerto Rico is concentrated almost exclusively in the San Juan Region. Office development in non-San Juan metropolitan area municipalities is limited to small office serving local communities and there is very little office development in the eastern region. Unlike on the U.S. mainland, there is no precedent in Puerto Rico for back-office functions located in outlying suburban areas like Fajardo, Ceiba and other east coast municipalities.

In evaluating development potential at Roosevelt Roads, the Consulting Team looked at the criteria used by companies considering back-office locations to assess how Roosevelt Roads compares. Key criteria include:

- Good quality, appropriately educated labor force within a reasonable commute (approx. 45 minutes)
- Competitive wages vs. headquarters locations
- Lower occupancy costs vs. headquarters locations
- Good transportation access
- Desirable site amenities (e.g. free parking, attractive office park campuses, nearby restaurants and services)

While currently not supportable, consideration should be given to marketing the site to back-office functions of large Puerto Rico companies including banks and financial services companies. Government offices would also be a potentially attractive submarket to target.

In addition to assessing opportunities for uses described above, the LRA determined it was important to understand the community’s needs for educational and hospital facilities. The Base has two schools—one elementary and one middle/high school—and one hospital. The schools are described as shown below:

	ELEMENTARY	MIDDLE/HIGH
CLASSROOMS	58	46
<i>Permanent</i>	41	38
<i>Temporary</i>	17	8
SIZE	85,280 SF	52,255 SF
CAPACITY	900 Students	600 Students

The community’s needs as expressed by the Department of Education and the Puerto Rico Health Department are summarized on the following page.

Schools

The Department of Education is interested in obtaining the use of the school facilities on the Base. It provided the following information in support of its request:

- The Ceiba school district has 1,179 elementary students in three schools, 573 junior high students in one school, 484 high school students in a single school, and 62 special education students for a total of 2,298 students. It reports that there is insufficient space at the junior high level and that the high school does not currently offer vocational courses, which it would like to do.
- The Naguabo school district has 2,464 elementary students in 10 schools, 1,044 junior high students in four schools, and 717 high school students on one campus. Like Ceiba, Naguabo reports that it needs more facilities at the junior high level and its high school does not offer vocational courses and wishes to do so.

Medical Facilities

The Puerto Rico Health Department reports that the Eastern Region of the island is lacking in certain types of hospital and medical facilities. In particular, Ceiba has no medical facilities such as emergency rooms, hospitals, rest homes, home care providers, diagnostic and treatment centers, rehabilitation centers, ambulatory surgery centers, laboratories or blood banks. There is also no hospital in Naguabo and only one diagnostic/treatment center. The existing Base hospital is a 3-story, 130,000 square foot facility with a capacity of 36 beds.

V. Land Use

This section of the Roosevelt Roads Reuse Plan presents the recommended lands uses for the Base, and the guiding policies for those uses. This chapter of the report presents a series of diagrams and images that summarize the site, its nine distinctive zones relative to the existing development at NSRR, potential areas for new development and those areas of the site that are to remain undeveloped for reasons that relate to conservation, or other physical or environmental considerations. Each zone is discussed as an illustrated comparative between what exists today as documented in the Zone Summaries, and proposed land uses for each zone. The comparative Land Use Summaries are intended to facilitate an understanding of the range of uses that the LRA intends to encourage and to which the eventual underlying zoning of the Base will refer.

This chapter also contains an illustration of the development phasing for the project with a series of illustrative tables and diagrams depicting development over a thirty-plus year period

Guiding Policies

The Reuse Plan for Roosevelt Roads was developed in concert with the Local Redevelopment Authority after the Consulting Team's investigation of the site's regional context, existing natural physical conditions and facilities, and market analysis, documented in an earlier report titled *Roosevelt Roads Reuse Plan: Site, Context and Market Conditions*, dated April 2004, and in subsequent reports to the LRA (see Appendix A). At the conclusion of the broad assessment, a series of opportunities and constraints were identified. Together with an understanding of the site's carrying capacity, and market absorption insights, the team was tasked with investigating a broad range of land uses responsive to key guiding policies. These policies emerged from community values expressed at public hearings with the LRA, within the LRA and its broad-based constituency, within the Consulting Team, and from entities that submitted Notices of Interest for Public Benefit Conveyances, which are discussed in Chapter VIII of this report.

Although the development of a Reuse Plan for Roosevelt Roads has been undertaken at an accelerated pace when compared to other base closures, the project shares many of the same concerns as other municipalities or states where military base closures have occurred. And in establishing a method for coming to terms with how the Base will be reused post-closure, a range of precedents, their successes and failures, have been investigated. Perhaps of most value is to understand that a community undergoing a military base closure has an opportunity to "vision" a new and compelling future that reflects the aspirations of that community, market forces and the site's natural

Roosevelt Roads Reuse Plan

“fit” with desired land uses. The momentum to plan for the future of the Base, with an emphasis on triggering growth in the local economy, is driven by the swift recognition that the region requires significant resuscitation to counteract the effects of the Base closure. That recognition guided land use planning for the reuse of the Base.

Three overarching principles have emerged in the determination of future land uses at Roosevelt Roads:

1. Reuse of Naval Station Roosevelt Roads must support the economic well-being of Puerto Rico: Job creation and economic expansion is essential to the coastal region in an area existing in the shadow of the Base for the last 60 years. The military base was a significant and essential component with respect to growth and development of the local community, often the key economic driver and employer and therefore integral to the well-being and economic life of the community.

Jobs requiring investment of intellectual capital, not just manufacturing, will be one of the most important goals of the reuse effort for Roosevelt Roads. Attracting this type of investment at the Base is contingent upon adopting the incentives, underlying zoning and recognition that this must be symbiotic with key assets of the Base: large waterfront and water view site with direct access to major transportation facilities: port, airport and regional road network; reusable infrastructure and a number of potentially reusable facilities; and a significant amount of developable land.

2. Existing needs of the communities adjacent to the Base will be considered in the Reuse Plan: The communities of Ceiba and Naguabo will share new access to the waterfront and water-oriented recreational opportunities, economic activity and cultural development that will energize the region. Many within the community have strong views of how the

Base should be reused. The Commonwealth has included leaders of these communities in the visioning effort, and accommodation of the aspirations articulated from within the community is a key goal for the Reuse Plan.

The Land Use Plan for the reuse of the Base will underscore the site’s regional and island context, will incorporate the substantial information and insights gained through the investigation of opportunities and constraints, and what these tell us in with respect to the types and placement of uses within the context of the site’s natural features and ecological sensitivity. Creating long-term benefit for the Commonwealth will be dependent not only on what gets built at the Base, but of equal importance, on the quality of what is implemented at Roosevelt Roads and how well it is timed to be absorbed by, and expand, the market.

In parallel with beneficial long term investment, the site’s ecology, its spectacular views towards the mountains, and towards the islands of Vieques and Culebra make it an ideal location for the kind of ecological tourism that requires that the preserve areas be protected and managed by those who will work to restore, protect and enhance it within the context of the regional effort. Its thousands of acres of mangrove forests and sea grass beds, virtually undisturbed during the Navy’s tenure, make this an exciting opportunity for regional conservation and the maintenance of a continuum of habitats.

3 Reuse of the Base will emphasize water-oriented uses: Puerto Rico is the easternmost island of the Greater Antilles, centrally located among the eastern Caribbean archipelago.

The site’s location at the mid-point of the eastern coast of Puerto Rico underscores its potential as a marine-oriented transportation linkage to the islands of Vieques and Culebra as well as to the US Virgin Islands. Of equal importance is the site’s unique land

Roosevelt Roads Reuse Plan

configuration. Twin peninsulas frame a well-protected Ensenada Honda. An extensive yet limited-access coastline and the extent of harborfront bulkheading create a most unique opportunity to orient a broad range of water-oriented uses as a priority reuse for the Base that will co-exist with the desire to ecologically link this site to other protected environments on the east coast of Puerto Rico and its islands. The waterfront at Roosevelt Roads will create an important regional development opportunity as one of the largest waterfront development sites under single ownership in Puerto Rico.

Land Uses Included in the Reuse Plan

In concert with the Guiding Policies, the findings of the Site Assessment, and the Market Analysis, land uses that have been incorporated into the Roosevelt Roads Reuse Plan can be summarized within six broad categories that include:

- Economic Development;
- Public and Institutional Use;
- Residential;
- Open Space and Recreation;
- Conservation; and
- Tourism

These and the aggressive schedule for development of the Roosevelt Roads Reuse Plan transcend the mere “wish list” that is a typical element of precedent base closure projects and serve to focus on what can be expected given community needs and resources, the scale of the site, the fragile economic environment, projected market absorption, and significant infrastructure costs. Thus, the uses in this Reuse Plan are prioritized accordingly.

Later in this section, illustrations highlight where these uses will occur together with an initial phasing projection.

Economic Development (Employment Generating)

Uses: One of the LRA’s key objectives for reuse of the Base is to emphasize economic development and consistent with this, prioritization of facilities at the Base that are deemed to have the potential to accelerate job creation. These uses will tend toward expansion of industrial and commercial development, creation of a science park with research and development facilities, and water-oriented commercial and recreational activity. At full build-out over 30-plus years, the projection of new jobs created would range from 18,200 to 19,700. Jobs requiring investment of intellectual capital, not just manufacturing, will be one of the most important goals of the reuse effort for Roosevelt Roads. Attracting this type of investment at the Base is contingent upon adopting the incentives, underlying zoning and recognition that this must be symbiotic with key assets of the Base: large waterfront and water view site with direct access to major regional transportation.

Public, Educational and Institutional Uses: Reuse of the Base incorporates a number of public uses that focus on reusing specific facilities at the Base identified in the April report as suitable for use by Commonwealth public agencies. Examples include the Commonwealth’s Public Utilities, Ports Authority, and the Department of Education as well as health care providers, universities and other academic institutions and the local communities, with projected advantageously limited capital improvement costs.

- *Reuse of the existing airport and operations buildings as a passenger and cargo facility:* The runway at Roosevelt Roads exceeds the length of runway required for modern aviation and its location at the foothills of El Yunque and in proximity to the islands of Vieques and Culebra make this an attractive loca-

Roosevelt Roads Reuse Plan

tion for passenger operations. Further, reuse of the airport will be compatible with development of adjacent land for industrial development in this portion of Puerto Rico.

- *Reuse of the newly re-bulkheaded waterfront at the northeastern portion of Ensenada Honda as a new passenger and light cargo ferry terminal to Vieques, Culebra and the US Virgin Islands:* At present, the islands of Vieques and Culebra are served by poor and infrequent ferry service to and from Fajardo. Somewhat unreliable, the ferry operates slow and outmoded equipment that crosses the 12 mile ride between Fajardo and Vieques in one and a quarter hours and in each direction, far longer than the trip requires. The ferry terminal at Fajardo is unappealing, in deteriorating condition, and poorly maintained. The Fajardo pier is in disrepair and has inadequate traffic handling capability. Travelers upon arrival are confronted by chaotic conditions. The ferry is the primary mode of transportation for the local island populations to and from mainland Puerto Rico. Currently, tourists are advised to fly to the islands from the San Juan airport. Establishing ferry service at the Roosevelt Roads site would cut the distance to Vieques in half to 6 miles. With modern passenger and cargo ferry equipment, and the ample parking availability at Roosevelt Roads, the site could offer a vastly improved base of operations for this essential service.

With thousands of square feet of reusable refrigerated storage space immediately accessible to the waterfront, the potential to develop a modern passenger ferry terminal and cargo terminal adjacent to newly bulkheaded waterfront will be of tremendous importance to the islands. Compatible with this, water-oriented commercial development along the waterfront, marinas, marine brokers, yacht charter, boat repair, refueling, sail makers, boat builders etc. can be accommodated at the Base.

- *Reuse of the Base hospital as a local hospital:* The approximately 131,000 square foot hospital at the Base has recently undergone significant renovation. It has the kind of facilities that are not duplicated in the local communities and will be of great value in bringing better medial care to this part of Puerto Rico.
- *Reuse of the elementary school as a public middle/high school:* The school district and the community have documented the need for additional classroom facilities at the middle and high school levels. A school at the Base would be suitable for reuse for this purpose. The elementary school at NSRR will require modifications to accommodate a middle and high school curriculum as well as the addition of playing fields.
- *Reuse of the middle/high school campus:* There is a keen desire to have an academically outstanding new bi-lingual private school at the Base. This is consistent with the expectation that the eastern region of Puerto Rico will continue to expand economically and experience substantial growth over the full build out of NSRR. The LRA anticipates the need for a bilingual school to accommodate the demand created by the science park, and the university.
- *University Campus:* A number of universities have expressed their desire to expand water-oriented research and technical programs, for which Roosevelt Roads would be very well-suited. The Commonwealth of Puerto Rico sees the alliance between university, science park research and technology development as critical to the expansion of Puerto Rico's economy. A university at the site would serve many purposes, particularly those that contribute to the development of a highly skilled and educated labor force for high technology, pharmaceutical and research enterprises. At Roosevelt Roads, there are existing academic, residential, and support buildings and facilities quite suitable for this use. A

Roosevelt Roads Reuse Plan

range of marine-oriented programs would capitalize on the availability of waterfront resources to support this educational effort.

Residential Uses: A broad range of sites appropriate for residential development have been identified at Roosevelt Roads. These occur in the southwest portion of the site, called “Bundy”, in the “Downtown” central section of the site, and on the southern peninsula, “Cabo del Sur”. The site is large enough to offer a broad range of potential residential opportunities, with a range of appropriate amenities.

- The opportunity to link compatible residential development to the development of the science park and the University is critical to the establishment of sustainable neighborhoods at Roosevelt Roads.
- The University Campus: The site can support residential students related to the reuse of the existing residential campus facilities near the airport. These are closely allied with and interconnected to the science/R&D program at the science park and to the water-orientation of the site; as well as, perhaps, the development of a water-view “faculty row”.
- A mix of densities ranging from 1 unit per acre to 8 to 10 units per acre would be appropriate and could be supported by the exiting infrastructure at the Base.

Open Space and Recreation: Numerous recreational opportunities are going to be incorporated into the future reuse of the Base, supporting residential and tourism objectives. Among these are:

- Expansion of the existing marina and development of adjacent water-oriented and water view recreational uses that could include tennis, miniature golf, kayak rental, water-skiing and parasailing, small boat rentals, etc., with associated retail.
- Expansion of the existing 9-hole golf course to an 18-hole public course.

- Development of a regionally interconnected ecotourism venue focused on the extensive mangrove, coral reef, and sea grass beds at the site, and the threatened and endangered species that inhabit them.
- Develop new and expanded marina opportunities in an ecologically appropriate manner.

Conservation: For the past six decades, under the Navy’s stewardship, thousands of acres of coastal mangrove forests and wetlands remain undeveloped. As the importance of the eastern region of Puerto Rico’s biodiversity emerges, support for continued conservation of the site’s natural areas has grown. It is hoped that at Roosevelt Roads, these conservation areas will become allied to and linked with other opportunities for conservation stewardship and educational initiatives within the region, resulting in a strong regionally interconnected venue focused on precious sustainable natural resources.

Tourism:

- The Commonwealth recognizes the need for the development of moderate tourism in Puerto Rico and this use can be very well accommodated in a number of locations at the Base, capitalizing on beautiful views at the higher elevations, and accessibility to water-oriented and ecotourism activities.
- There is tremendous growth in planned tourism expansion all along the eastern coast as well as the expansion of tourism in Vieques and Culebra. In the short to intermediate term, these planned projects will likely fulfill the demand for resort development at the higher end of the market, but longer term, this use could become a potential opportunity at Roosevelt Roads as well.
- Ecotourism: Roosevelt Roads is an ecologically significant site. Preservation of nearly 50% of its land area and an even greater percentage of its coastline will achieve a high degree of flora and fauna habitat sus-

tainability. This opportunity, together with other important efforts being supported regionally by public and private resources—the Conservation Trust of Puerto Rico’s Las Cabezas de San Juan and its restored lighthouse, “El Faro”, which can be seen along the coastline to the north of Roosevelt Roads, as well as the conservation efforts on Vieques and Culebra—should be harnessed at the Base. From seasonal habitat for migratory birds to primal habitat for a diminishing manatee population, proximity to well-established ecotourism venues will help to preserve the natural beauty of the site and its unique coastline.

Land Uses and Development Program

Proposed land uses are presented in the remaining sections of this chapter. For planning purposes, the Base has been divided into nine sub-areas, or zones (see Figure V.1). Table V.1 sets forth on a zone-by-zone basis, the land uses, acreage, and development program (e.g. number of residential dwelling units, hotel rooms, building square footage, etc.) for the site. It also provides preliminary estimates of total jobs (18,200-19,700) and total residents (6,257) upon full 30-plus year build out.

Roosevelt Roads Reuse Plan

Table V.2 presents a Zone Matrix which depicts in detail how the acreage available for reuse was calculated. Following Table V.2, a series of drawings and photographic images illustrate each zone. Note that there are two drawings for each zone. The first sets forth existing conditions and a breakdown of acreage by categories including existing developed land, slopes in excess of

15% (and, therefore, not readily or cost-effectively developable), vacant land available for development, operationally significant buildings, and areas designated for transfer by the Navy to other Federal agencies. The second drawing shows the proposed land uses and where they would be located within the zone.

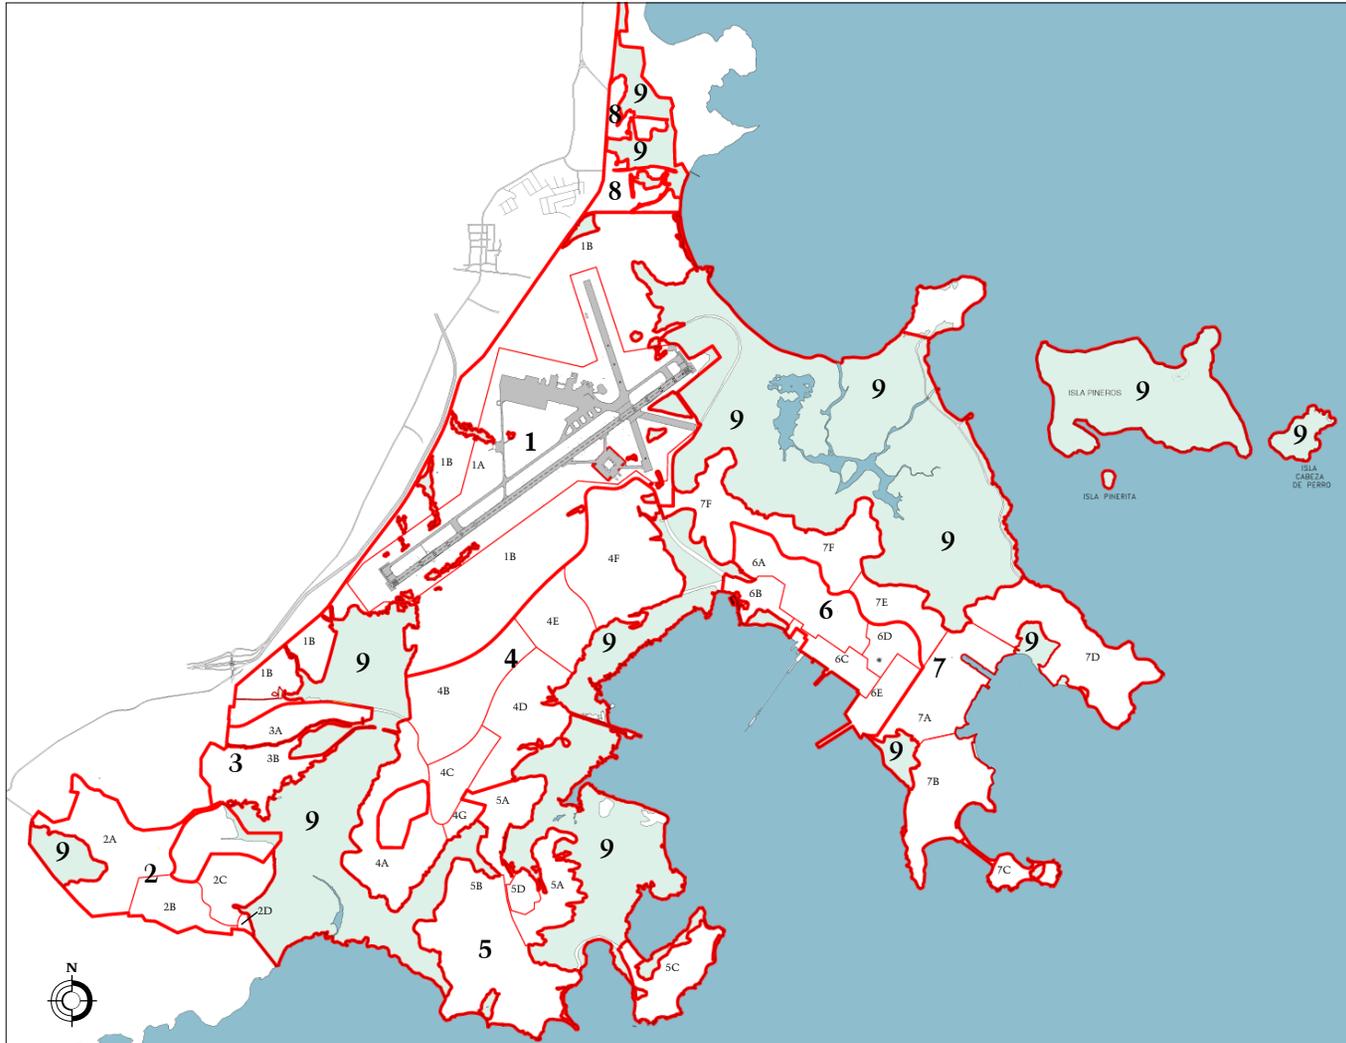

Figure V. 1
Location of
Zones 1-9

Roosevelt Roads Reuse Plan

Figure V.2
Zone 1 (N)
Existing Land Use

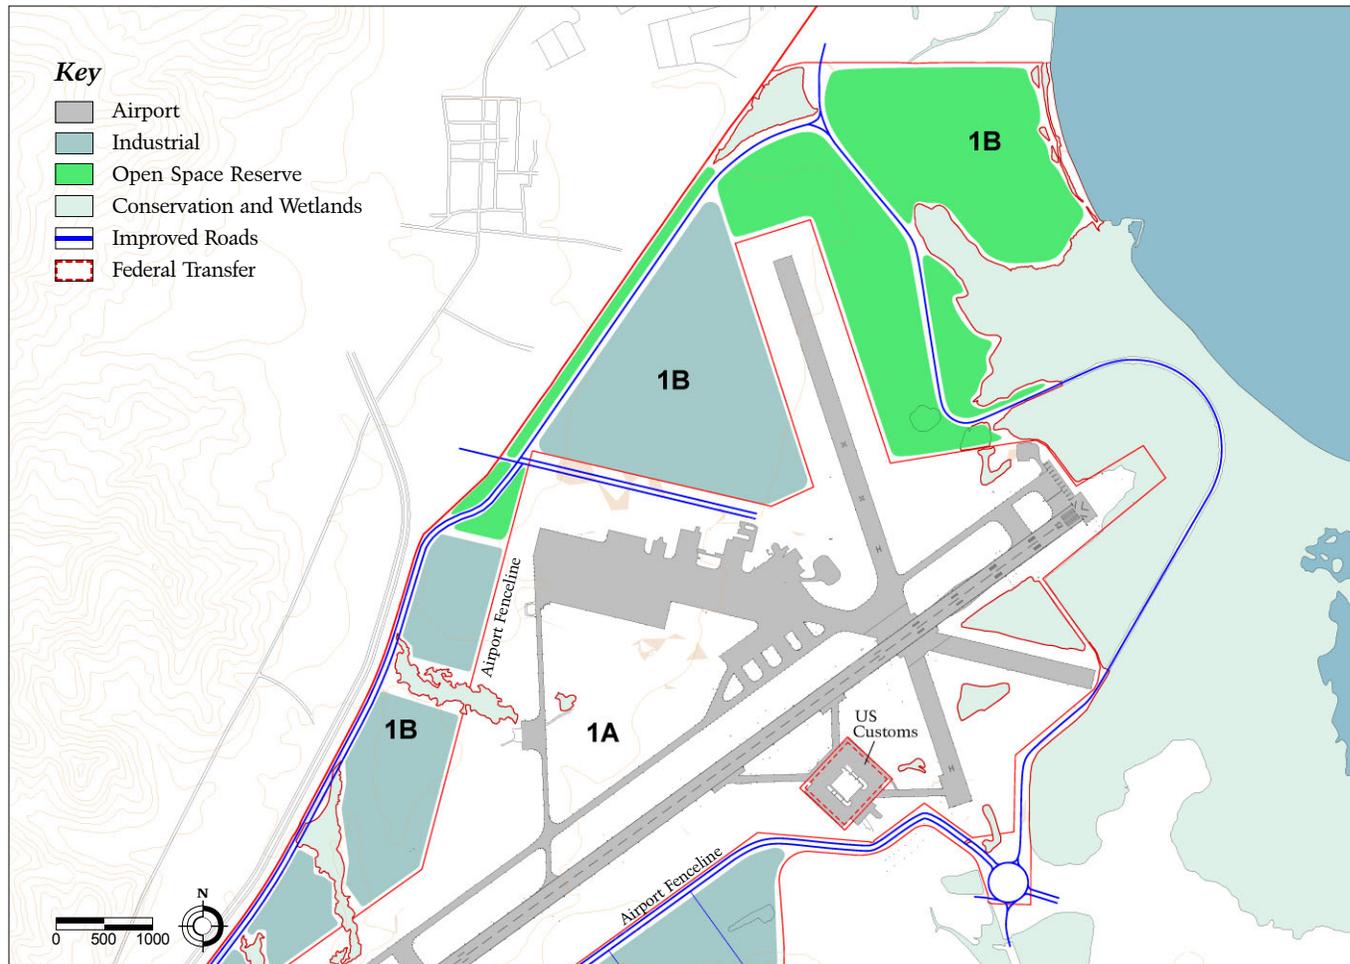

The northern portion of Zone 1 includes the airport and the potential development areas outside of the airport fence line. Nestled into a valley surrounded by the foothills of the coastal mountains to the north and the Delicias Hills to the south, this zone is characterized by consistent topography, and dense perimeter vegetation which effectively conceals its visibility from the surrounding community. The airport's most significant feature is its 11,000 foot long runway. In addition, there is a shorter, secondary runway, a helipad, and buildings adaptable for reuse as small passenger terminal, maintenance, cargo hangars and storage facilities

Existing Site Photos
L to R: Mural in Main Terminal; Redtail Building; Main Terminal and tarmac

Roosevelt Roads Reuse Plan

Figure V.3
Zone 1 (N)
Proposed Land Use

Proposed land uses include an operating airport serving both passenger and cargo needs, with new access directly from the regional road network to augment security of the airport, a priority in the post-9/11 world. Industrial use adjacent to the airport will dominate the new developable acreage in this zone, capitalizing on a potentially sizable and topographically gentle terrain suitable for this use typology with its specific operational requirements. Selective clearing along the northern boundary of the industrial parcels will yield good visibility for new corporate tenants.

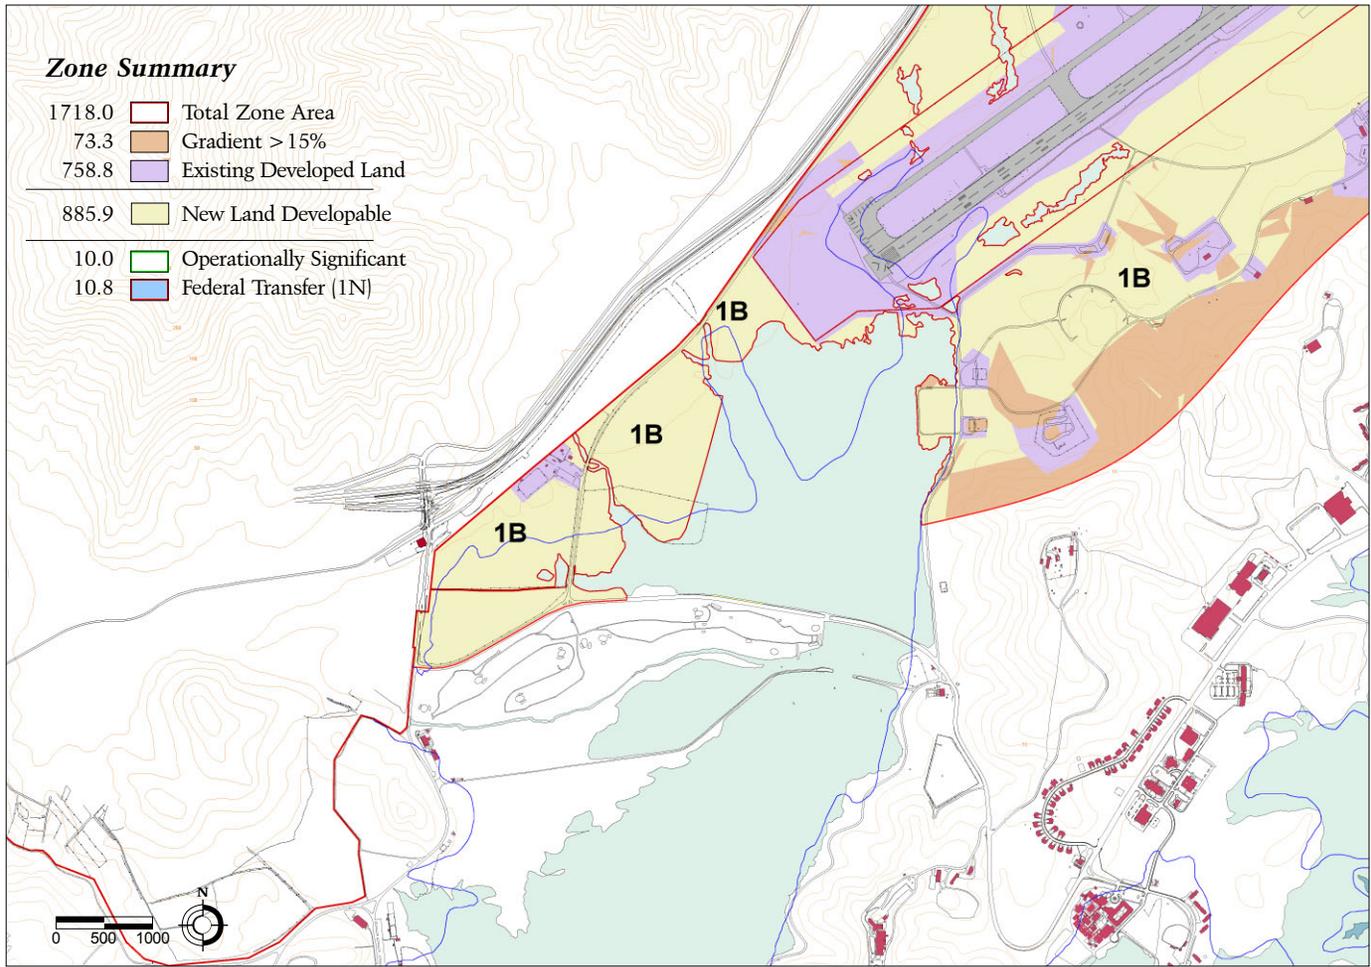

Finally, a large open space reserve to the north of the airport will establish a landscaped setting, an aesthetically controlled “front door” that will serve to create value to the new industrial development as well as to the entire site.

Proposed Precedents
L to R: International Trade Zone (Mt. Olive, NJ); Tree-Lined Road (Daniel Island, NC)

Roosevelt Roads Reuse Plan

Figure V.4
Zone 1 (S)
Existing Land Use

The southern portion of Zone 1 will contain a portion of the airport and its surrounding low-lying wetlands. There is significant new development area identified between the airfield and the north face of the Delicias Hills.

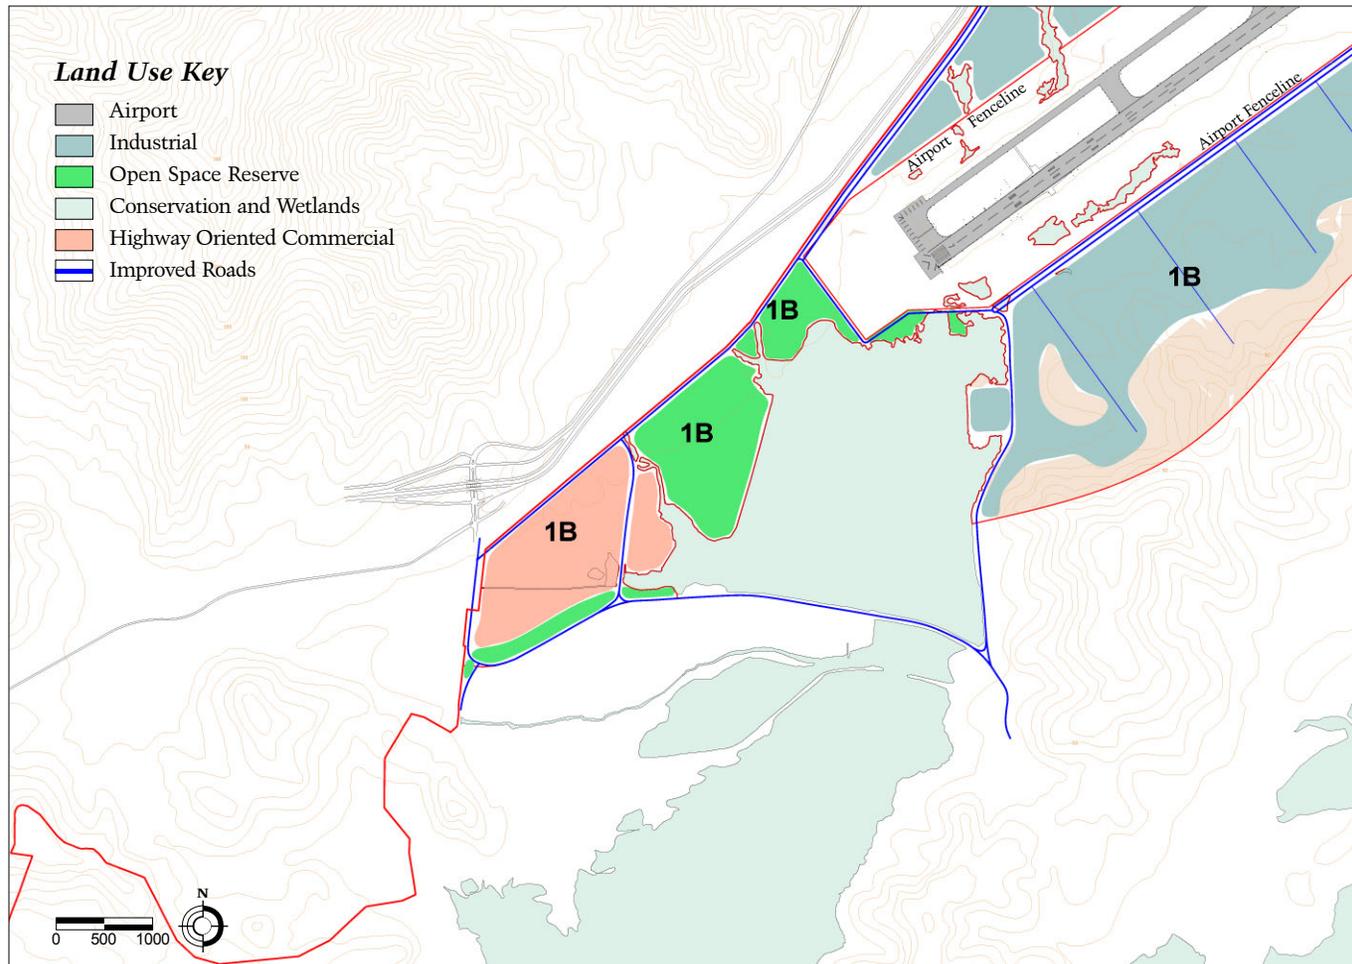

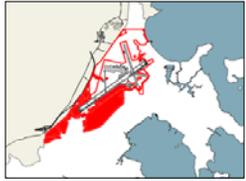

Existing Site Photos

L to R: Las Delicias Hills from Airport, Runway, Existing Airstrip Facilities

Roosevelt Roads Reuse Plan

Figure V.5
Zone 1 (S)
Proposed Land Use

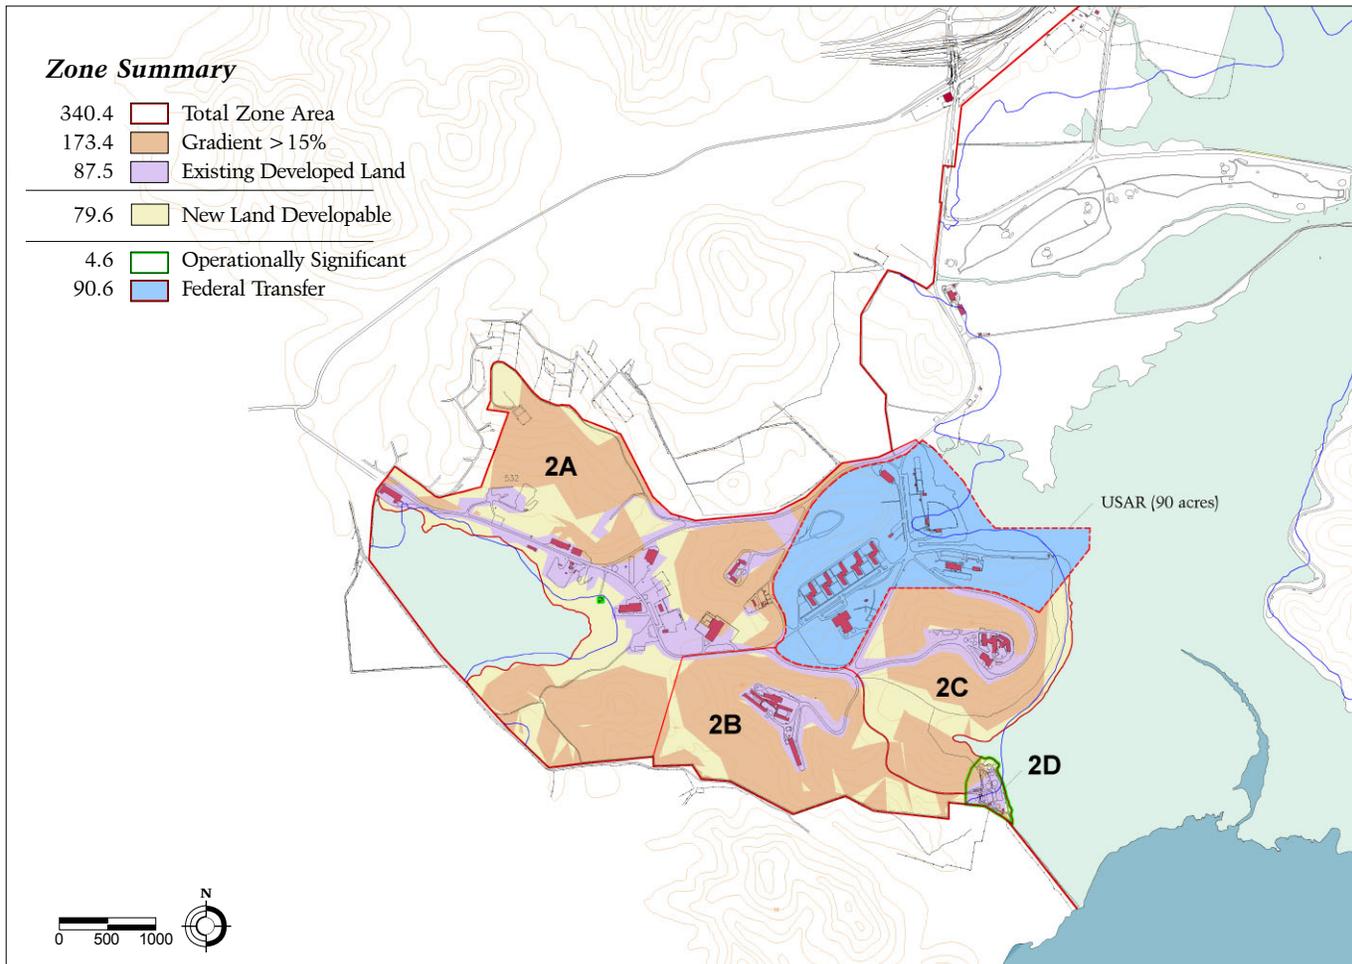

This zone will continue to incorporate the south-western end of the airport runway with parcels immediately beyond the runway held as open space reserve responding to safety and noise concerns. Highway-oriented commercial development is anticipated as an appropriate use adjacent to the Southern Gate and will feature excellent visibility from the regional road network; new industrial development will be accessed from improved roads at the site.

Proposed Precedents
L to R: International Trade Zone (Mt. Olive, NJ); Ibid.; Cityplace (West Palm Beach, FL)

Roosevelt Roads Reuse Plan

Figure V.6
Zone 2
Existing Land Use

Topographical interest and high elevations in the “Bundy” area offer some of the most dramatic distant water views at the site. “Bundy” supports direct vehicular access to the neighboring community of Naguabo. Existing facilities are decentralized, with lodging facilities sited to capitalize on spectacular views to the south and west, a tightly configured residential campus at the center of the site, and small storage and office structures loosely sited along the roadway (2B). A well-appointed and commodious fitness center with outdoor pool is fully operational (2A). A sewage treatment plant (2D) is not visible from the development areas.

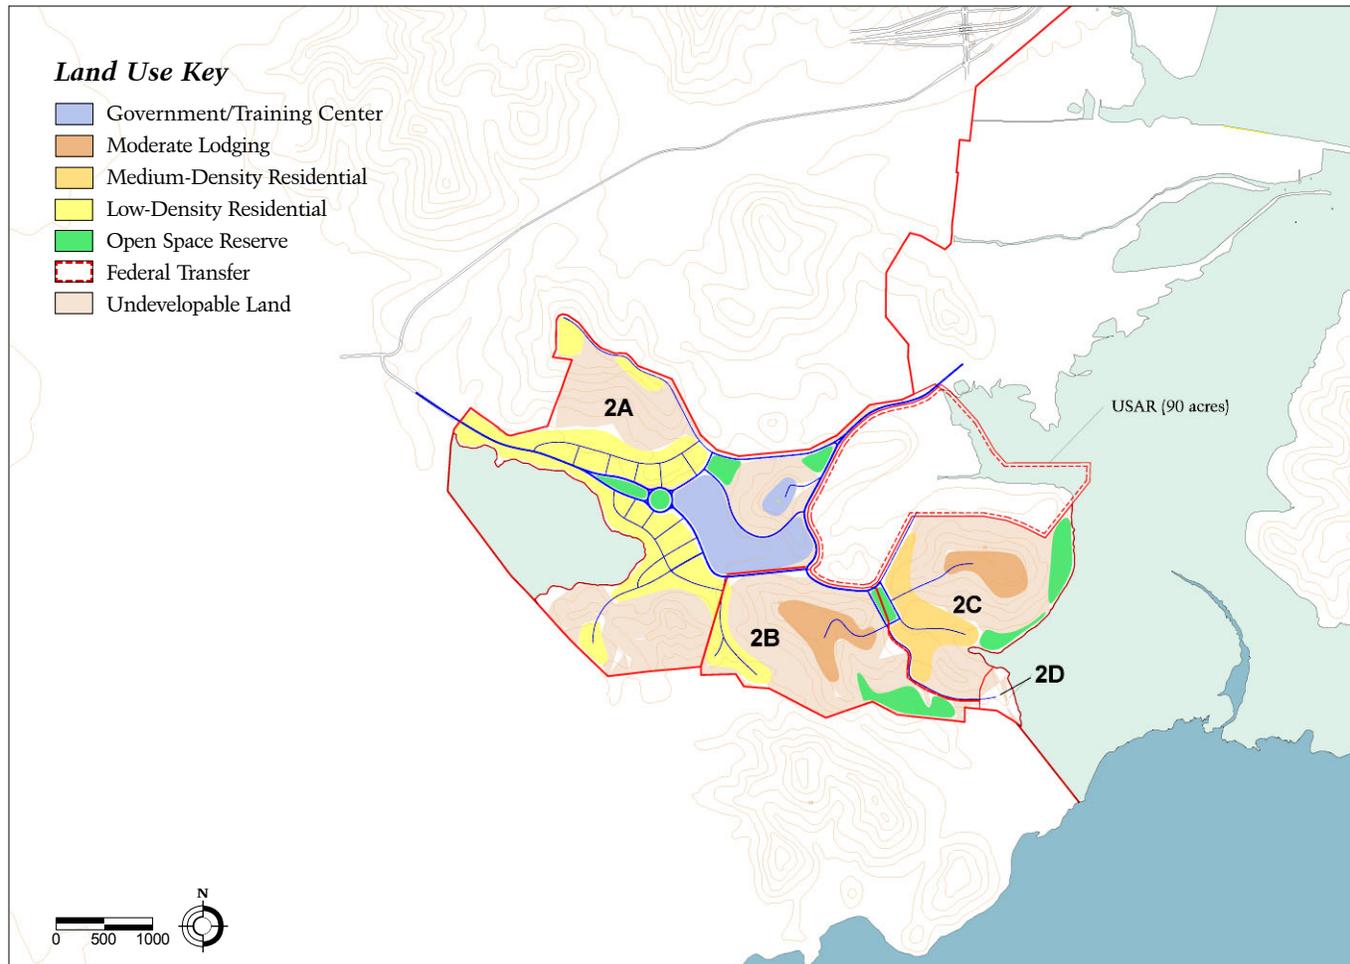

Existing Site Photos
L to R: North Mountain Views from Bundy;
Fitness Center Pool;
Elevated Water Views

Roosevelt Roads Reuse Plan

**Figure V.7
Zone 2**

Proposed Land Use

Land uses in this zone will include learning/government training facilities (2A); the fitness center with its large outdoor pool and air-conditioned gymnasium and courts. There are excellent sites for moderate lodging facilities with commanding views of Ensenada Honda and the islands (as well as to the southwest (2B, 2C). Low and moderate density residential development occur on sites adjacent to the existing community (2A) as well at the higher elevations (2B and 2C). The existing sewage treatment plant (2D) is in full operation and is not visible from proposed development areas.

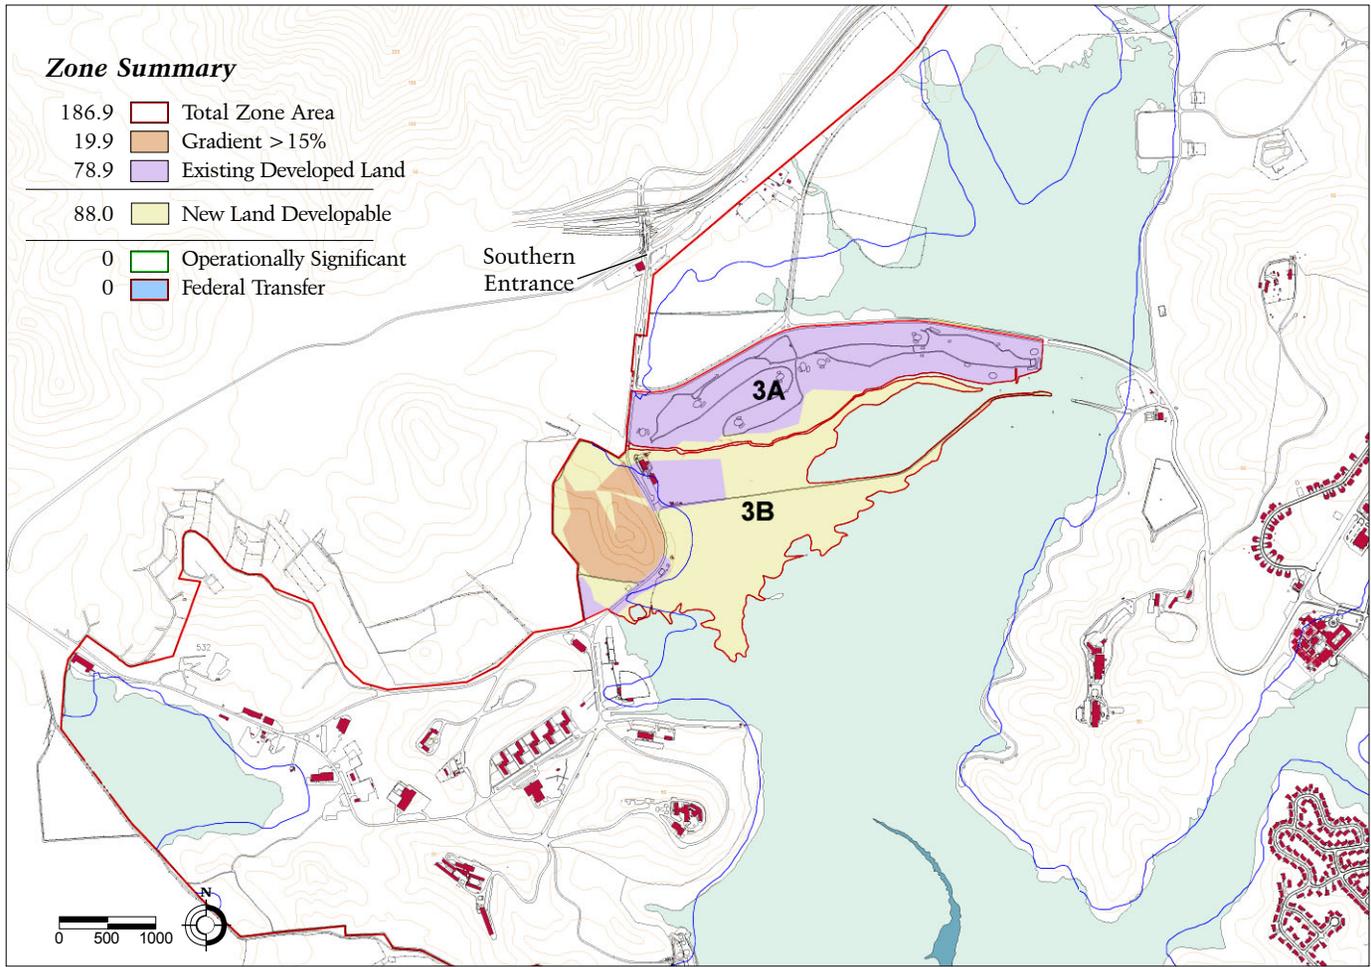

Proposed Precedents

L to R: Single-Family Home with Shaded Outdoor Room (Seaside, FL); Spanish Colonial Style Building (Palm Beach, FL); Home (Key West, FL)

Roosevelt Roads Reuse Plan

Figure V.8
Zone 3
Existing Land Use

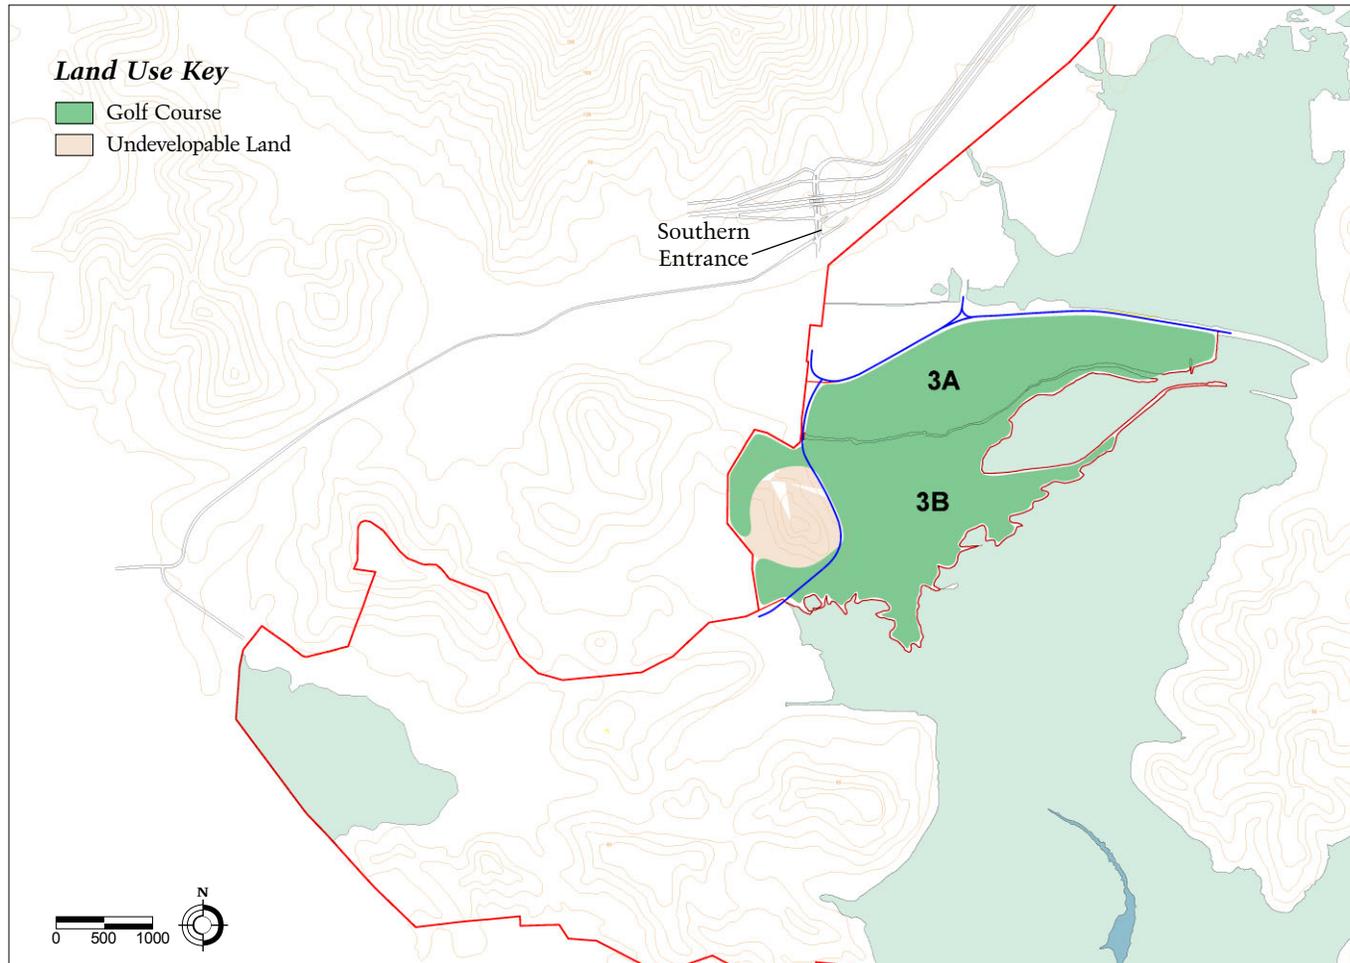

An existing modestly configured 78.9-acre 9 hole golf course is the single existing land use in Zone 3. The golf course is adjacent to central low-lying floodplain areas and is seasonally impacted by this proximity.

Photos
L to R: Golf Course; Bougainvillea

Roosevelt Roads Reuse Plan

Figure V9
Zone 3
Proposed Land Use

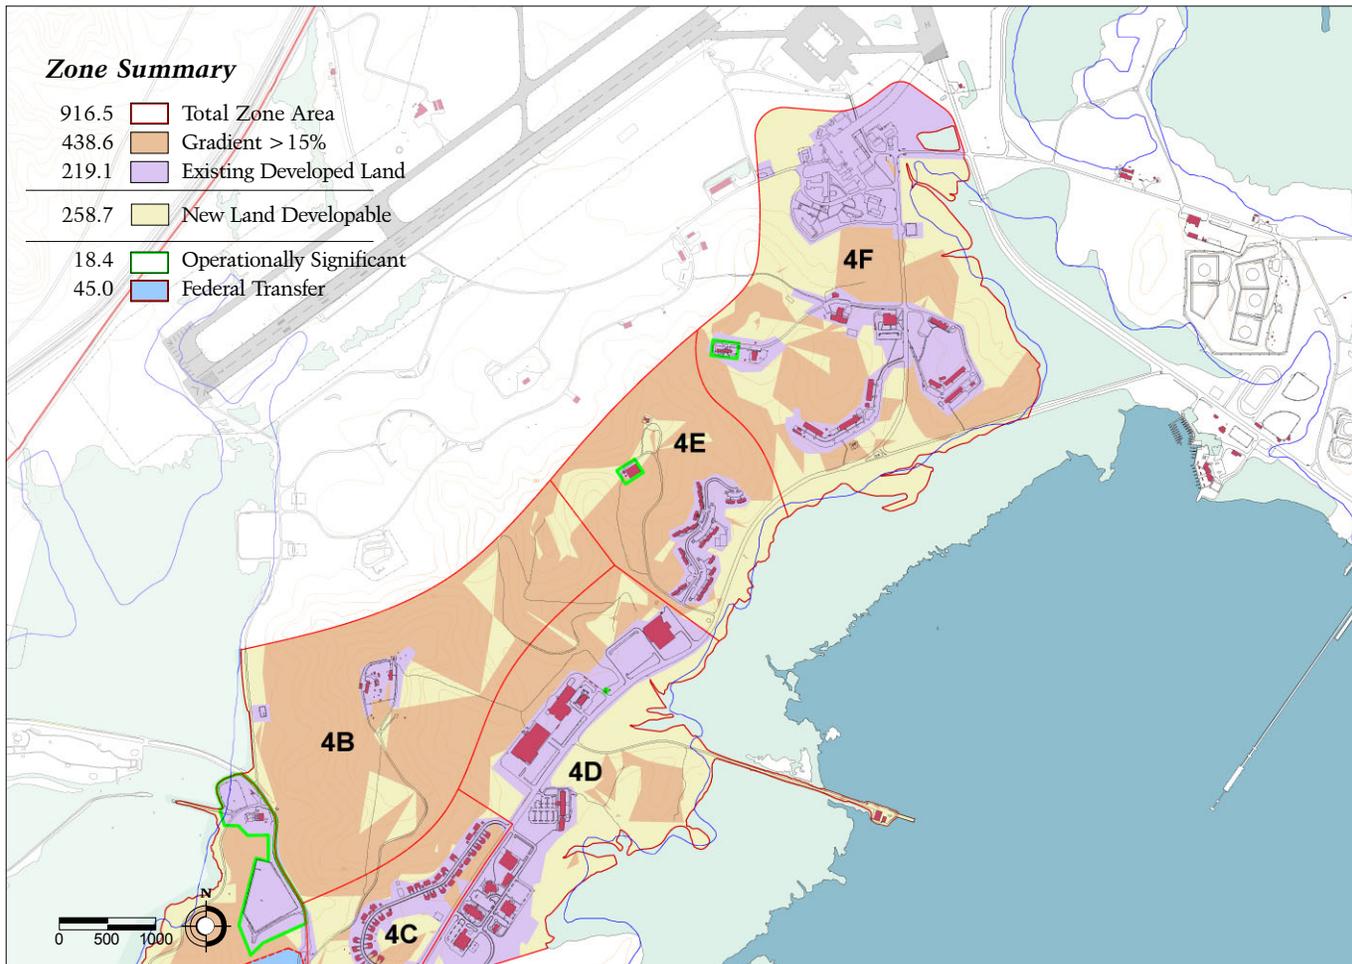

Proposed land use for this zone includes a 166.9 acre public golf course, expanded and reconfigured for full-playing 18 holes with adjacent driving range. In its reconfiguration, issues related to site retention would alleviate seasonal flooding.

Proposed Precedents
Golf Courses in Puerto Rico

Roosevelt Roads Reuse Plan

Figure V.10
Zone 4 (N)
Existing Land Use

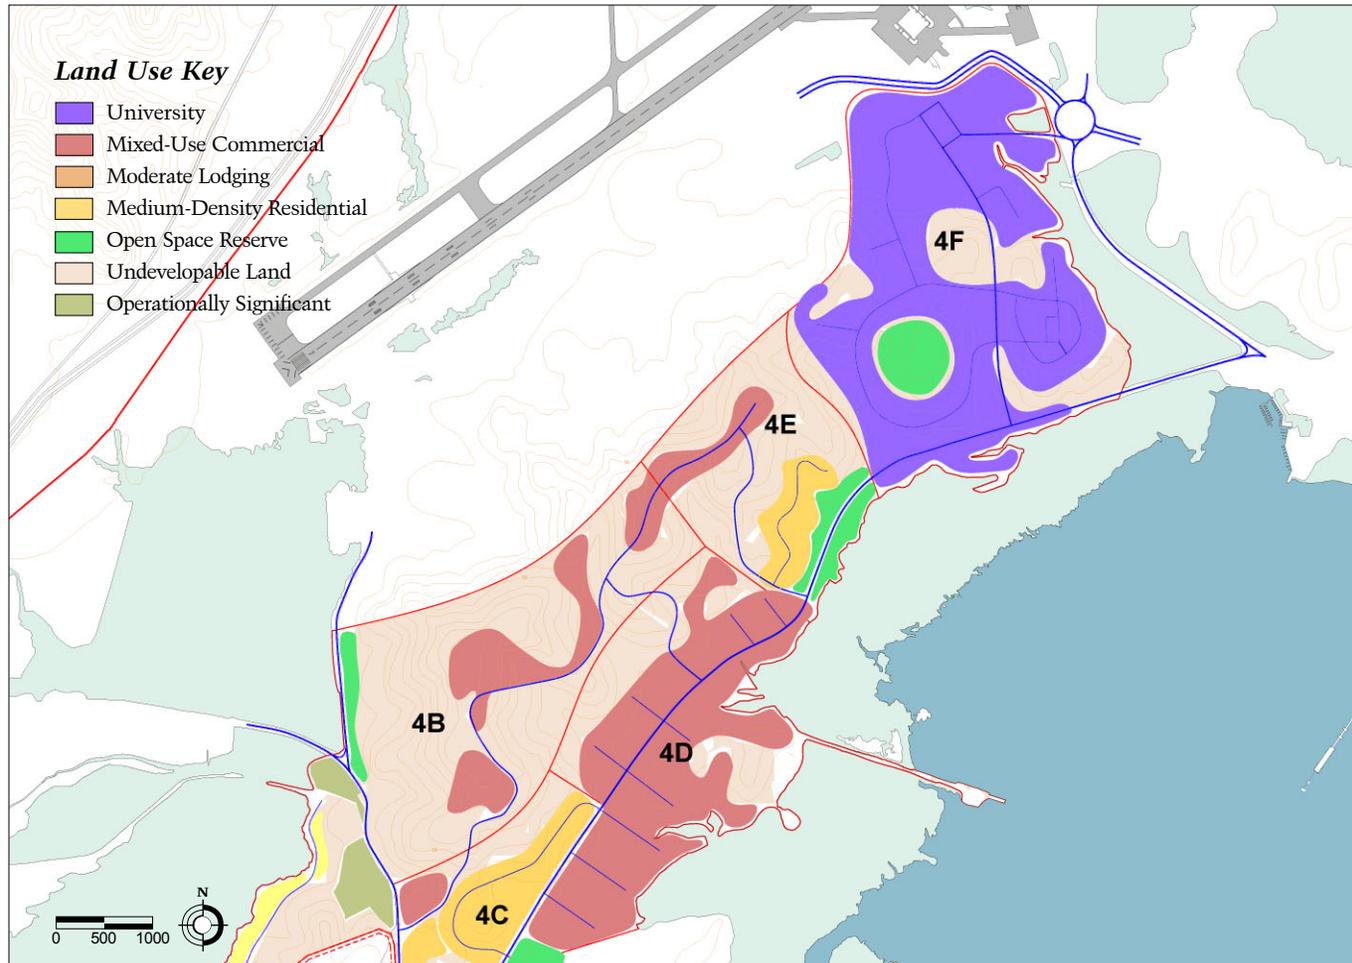

This zone encompasses the northern and southern portion of the Delicias Hills, an undulating elevated ridge that buffers airport activity from the central portion of the site. These are among the highest elevations at Roosevelt Roads. At the top of these hills, fragmented small sites (4B) are suitable for development, capitalizing on unobstructed waterfront views over Ensenada Honda and the Sound, the twin peninsulas, and to El Yunque to the northwest. Sited along the base of these vegetated hills, the “Downtown” at Roosevelt Roads consists of topographically level development areas suitable for reuse(4D). This central location allows access from both existing entrances to the property.

Existing Site Photos
L to R: BEQ;
Commissary;
Interior of Navy Exchange

Roosevelt Roads Reuse Plan

Figure V.11
Zone 4 (N)
Proposed Land Use

At full build out, this 165.6-acre loosely-organized campus (4F) appropriate for reuse as a university will include nearly 900,000 sf of classroom, office, residential, support and recreational facilities clustered at the northern portion of zone 4(N), just below the airport. New apartment quarters for enlisted personnel were recently completed by the Navy and are envisioned, with modification, for residential use (4E). Mixed-use commercial, moderate lodging, service retail and civic development is envisioned for this zone, much of it concentrated along the main street that links north and south peninsulas (4D); a small residential neighborhood is adjacent to this area (4C). The high slopes in 4B and 4E may deter development in this area.

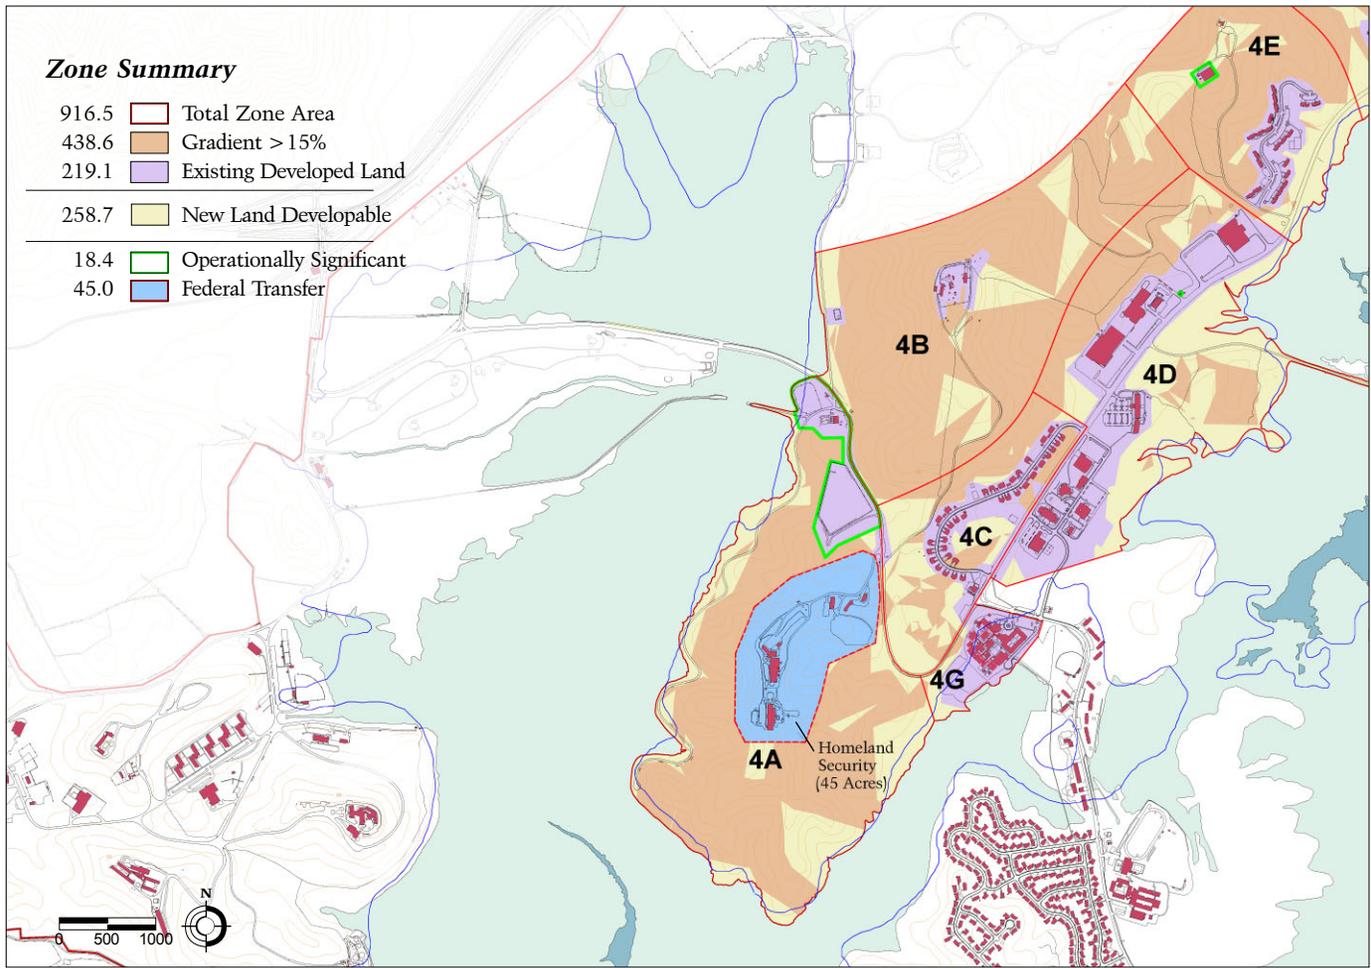

Proposed Precedents

L to R: Mixed-Use Building (Palo Alto, CA); Streetscape (West Palm Beach, FL); Cityplace (Dallas, TX); Old Convent Courtyard (San Juan, Puerto Rico)

Roosevelt Roads Reuse Plan

Figure V.12
Zone 4 (S)
Existing Land Use

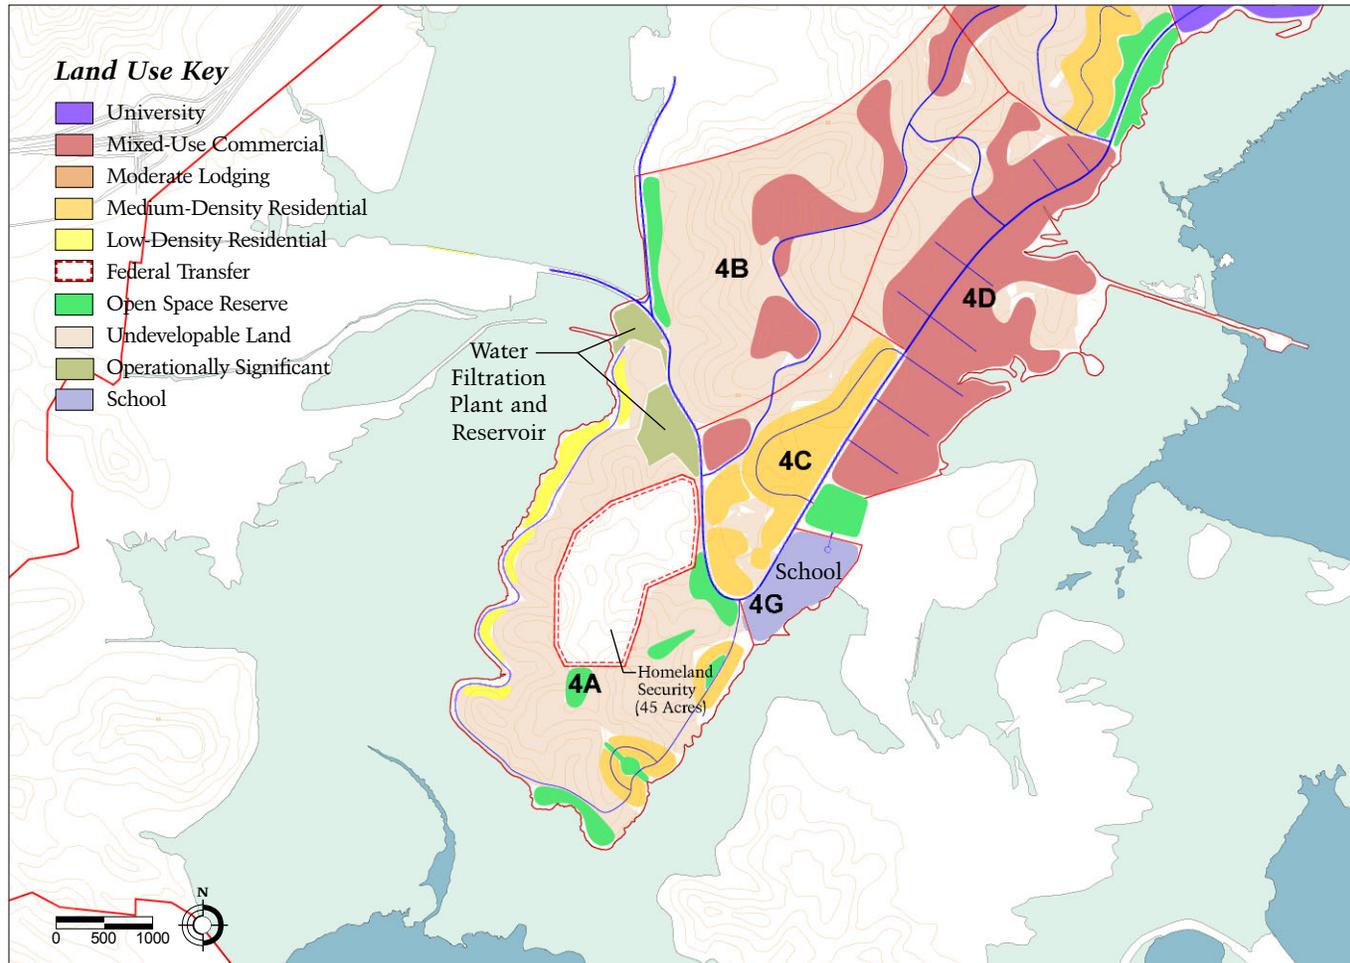

Just 75 acres (4A and 4B) have been identified as available for reuse in the southwestern portion of Zone 4 primarily due to the predominance of steep topography. However, much of that acreage would provide excellent water views and have the advantage of proximity to the “Downtown” area. There is an existing public school and playing fields on a 16.8 acre site (4G) at the southern portion of the “Downtown” area.

Existing Site Photos
L to R: Navy Exchange;
Elementary School;
Medical and Professional
Office Building

Roosevelt Roads Reuse Plan

Figure V.13
Zone 4 (S)
Proposed Land Use

At the top of the Delicias ridge, fragmented sites with asymmetrical configurations are suitable for a range of small-scale mixed-use commercial uses, capitalizing on dramatic views but having limited parking capacity (4B). A narrow band of land at the northwestern edge of foothills in 4A provides an opportunity for a limited number of single-family residences. New multifamily residential sites at the southwestern fringe of the hills can carry approximately 90 residential units (4A). The Base water filtration facility is operable and has a large storage reservoir, both located at the northern tip of Zone 4A. An existing public school would remain as a public school facility housing middle school and high school grades (4G).

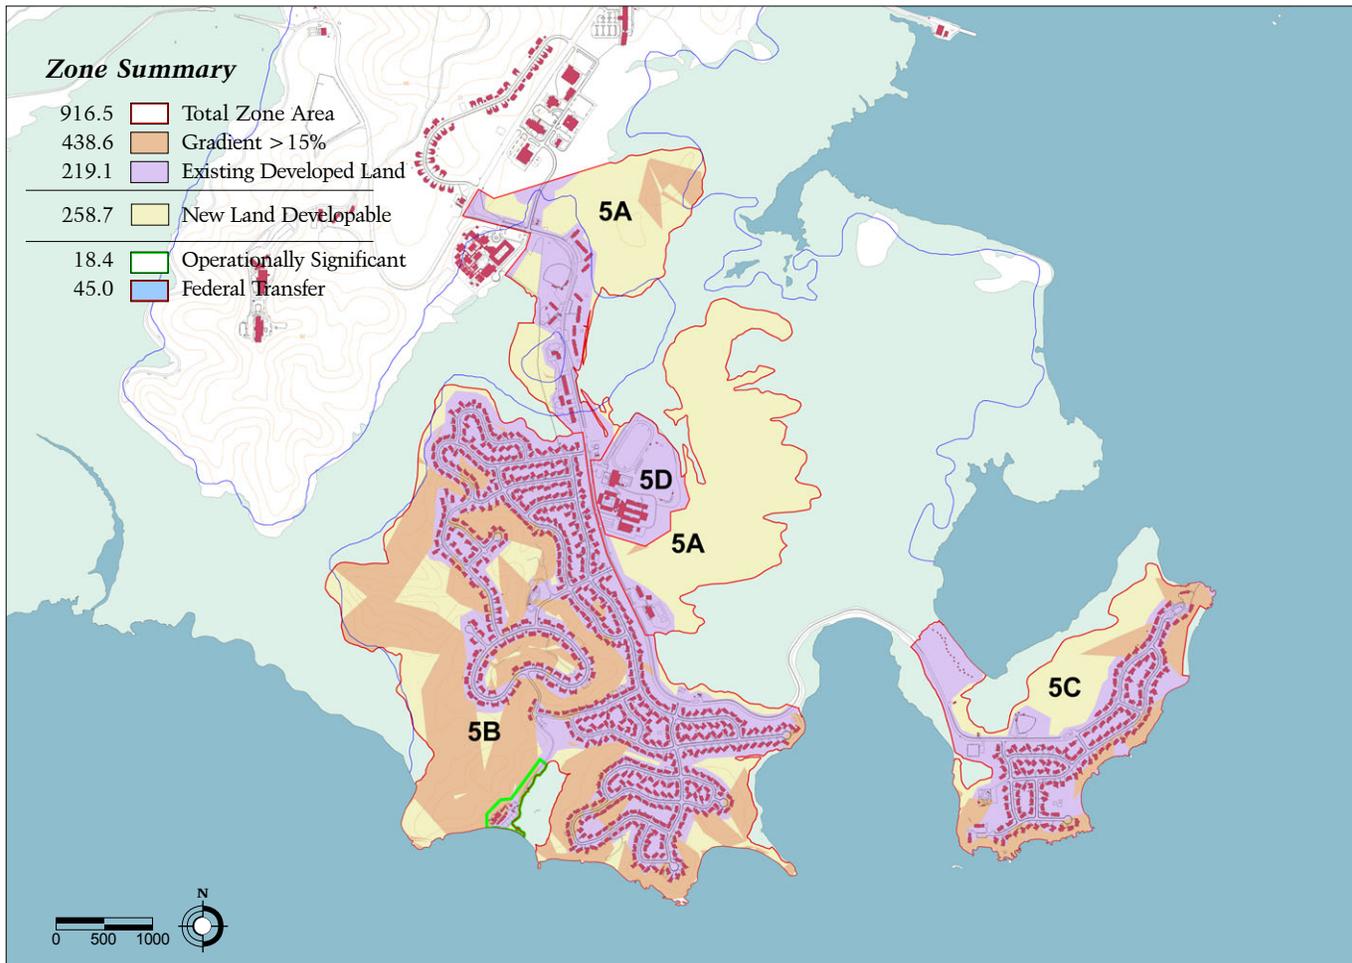

Proposed Precedents

L to R:
Medium-Density Housing (Old Fort Bay, Nassau);
Multifamily Residential (Puerto Rico);
Downtown-Style Street (West Palm Beach, FL)

Roosevelt Roads Reuse Plan

Figure V.14
Zone 5
Existing Land Use

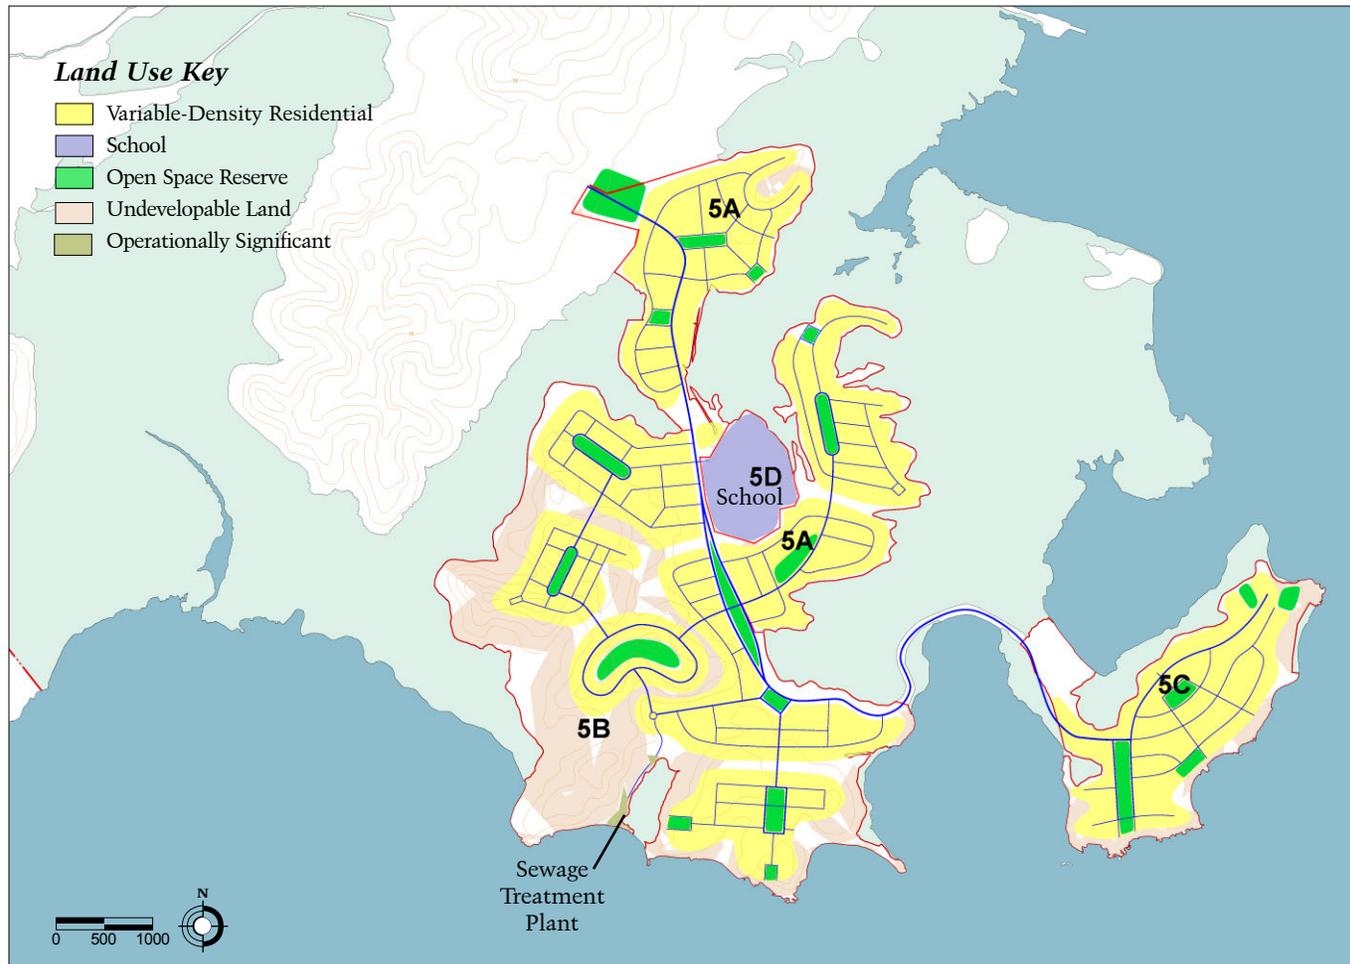

The southern peninsula is elevated, partially developed, heavily vegetated, and, most importantly, appears to be relatively free of environmental contaminant concerns. This needs to be confirmed within the scope of the Navy's current environmental assessment. Existing modest multi-family units and single family 'Capehart' housing, storage and maintenance facilities are loosely sited along the main access road and hilly cul-de sacs (5A, 5B). Views toward the islands from the south and southwestern coastline (5B), and from the "boot" of the peninsula (5C) are among the most dramatic water views at the Base. An existing high school with large indoor gymnasium and outdoor playing fields is suitable for reuse (5D).

Existing Site Photos
L to R: Waterfront Homesites; High School

Roosevelt Roads Reuse Plan

Figure V.15
Zone 5
Proposed Land Use

“Cabo del Sur” can provide a broad range of residential development opportunities, with nearly 462 acres of gross developable land (5A, 5B, 5C). Variable densities will range from single family dwellings at 2 units per acre up to 8 units per acre for multi-family homes, depending on market demand. At full build out, existing infrastructure can support up to 3,000 residents.

Reuse of the existing high school as a private bi-lingual school would be consistent with adjacent uses.

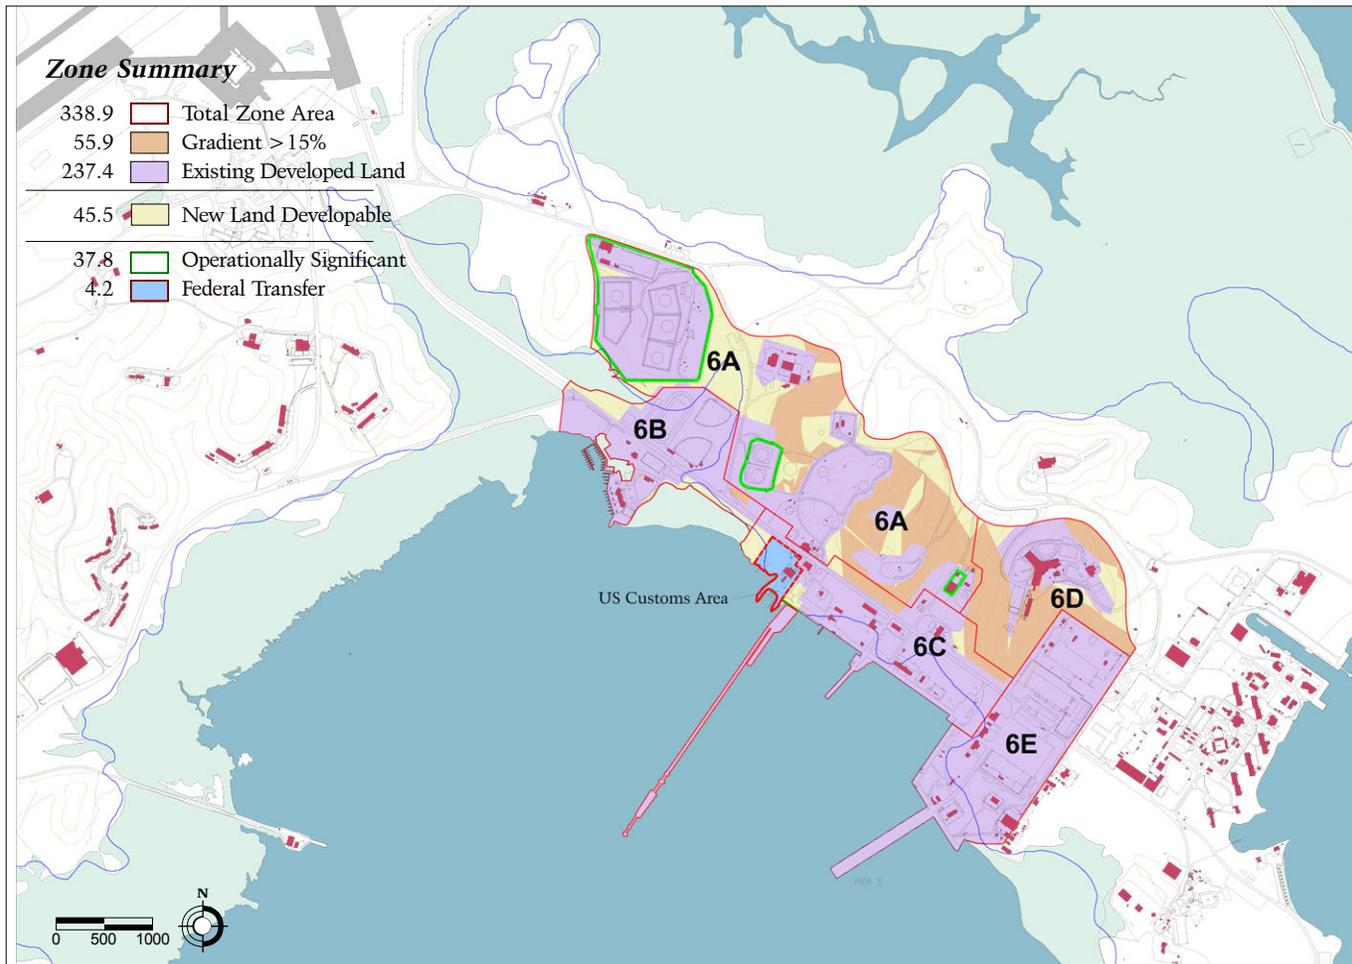

Proposed Precedents

L to R: Caribbean Detailing (Vieques, Puerto Rico); Spanish Colonial-Style House (Vieques, Puerto Rico); Neighborhood View (Old Fort Bay, Nassau)

Roosevelt Roads Reuse Plan

Figure V.16
Zone 6
Existing Land Use

Of 245.3 usable acres, only 45.6 acres are undeveloped in Zone 6. Encompassing a significant portion of the most accessible coastline at NSRR, this zone is naturally organized as a series of sites parallel to the northeastern edge of Ensenada Harbor. A central ridge runs the length of the northern peninsula at NSRR, forming a natural division between hills and harbor. The northern portions of this zone are dominated by eight large-scale, above-ground fuel storage tanks, augmented by additional areas devoted to fuel-related uses (6A). Waterfront sites along the length of extensive bulk-heading include a 72-slip small-boat marina and nearby tennis and baseball facilities (6B). An adjacent harbor terminal, a 2600 foot long fixed fuel pier (6C), adjacent pier and a loose collection of structures parallel to the bulkhead characterize the water's edge as a "working" waterfront currently devoid of public amenities such as landscaping, lighting, seating and wayfinding. NSRR's hill-top hospital (6D) was recently upgraded. Base headquarters, a large high-bay public works building and refrigerated storage structures are located near the recently upgraded Pier 3 (6E).

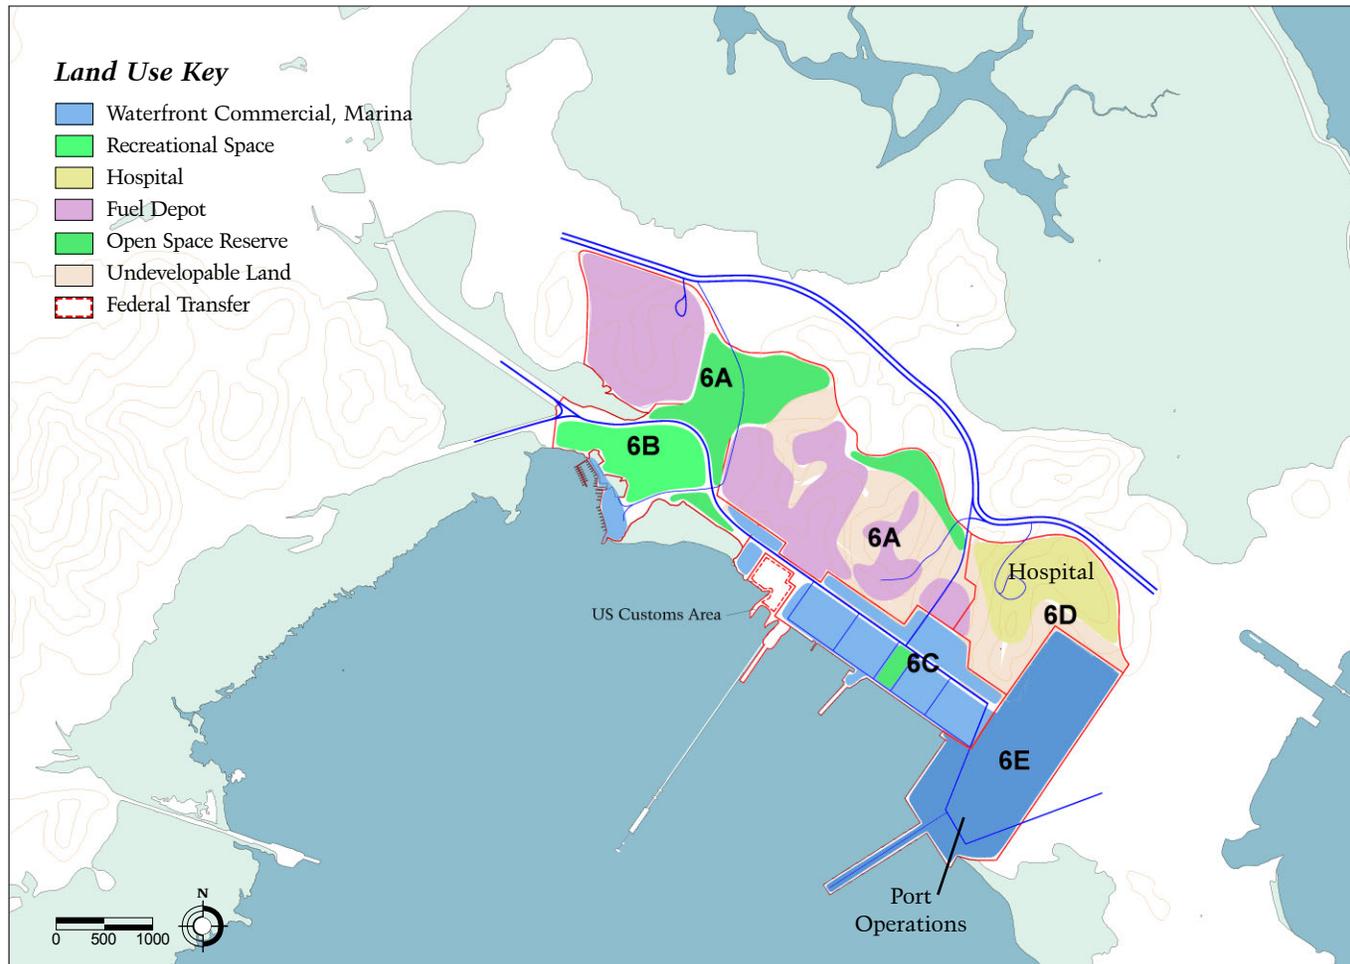

Existing Site Photos

L to R: Looking Southwest down the Length of the Fuel Pier; Existing Marina; Looking Southeast along the Harbor

Roosevelt Roads Reuse Plan

Figure V.17
Zone 6
Proposed Land Use

The fuel storage areas are likely to remain and may be of advantage to the future of the airport and also to on site maritime activities (6A). The proposed land uses for this zone anticipate a transition to water-oriented commercial uses. These will be triggered by infrastructure improvements to expand the existing marina with additional boat slips and small-scale supporting retail and to create an adjacent highly accessible recreational open space (6B). Charter and yacht brokerages, small cruise ships, boat repair and marine-oriented retail are encouraged along the waterfront (6C). New passenger and cargo ferry service between NSRR and the islands of Vieques and Culebra supported by cargo storage facilities, public parking and inter-modal transportation will be located along Pier 3 and the adjacent upland acreage (6E). The hospital would be reused, serving regional and community needs (6D).

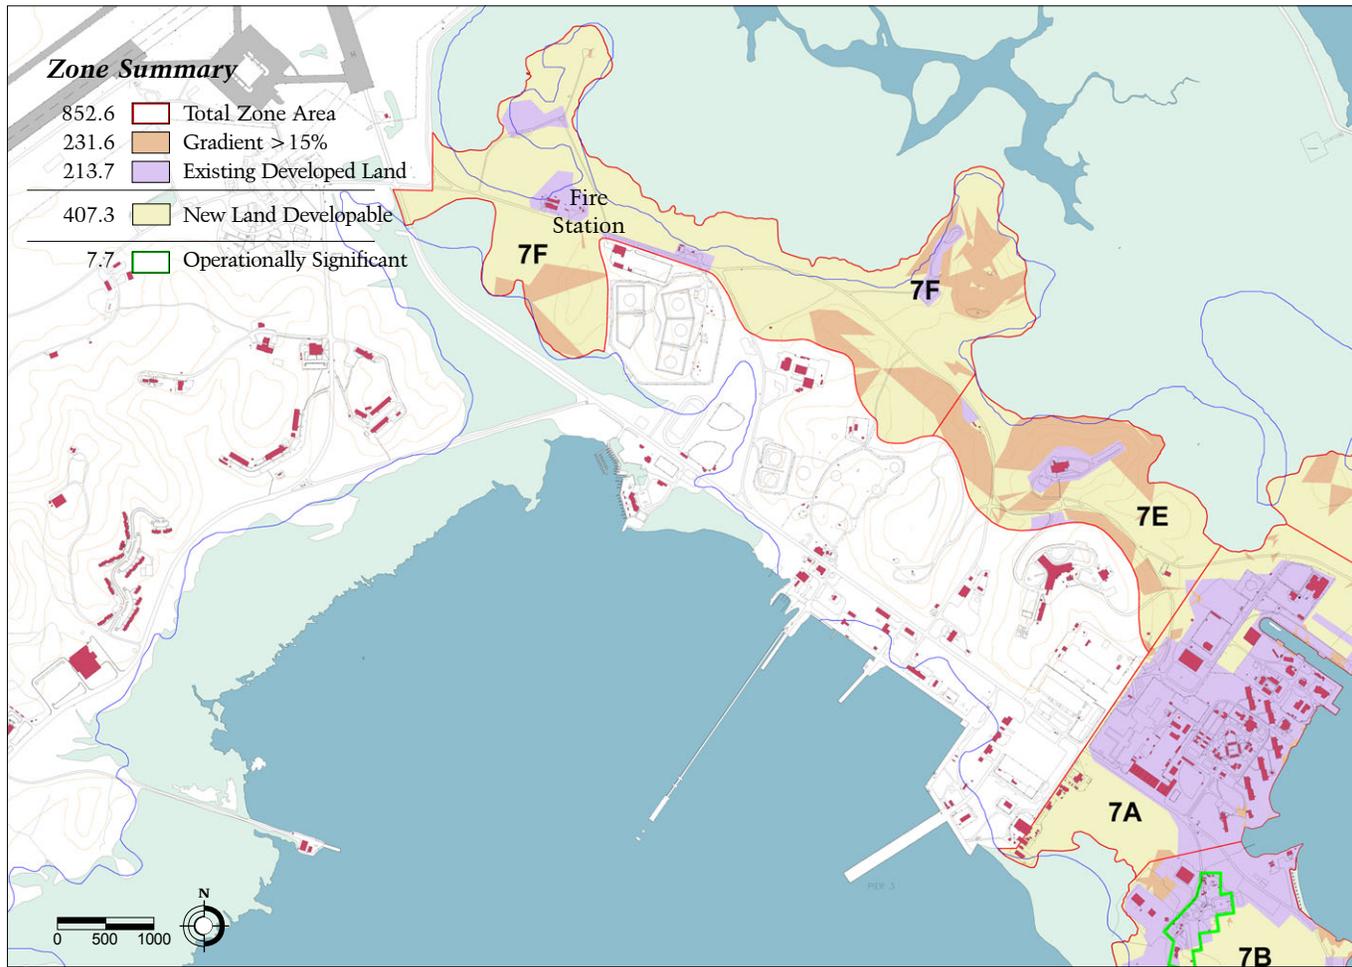

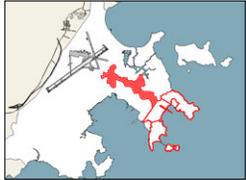

Proposed Precedents

L to R: Ferry and Charter Marina (Cape Town, South Africa); Waterfront Esplanade (San Diego, CA); Mixed-Use Working Waterfront (Cape Town, South Africa)

Roosevelt Roads Reuse Plan

Figure V.18
Zone 7 (N)
 Existing Land Use

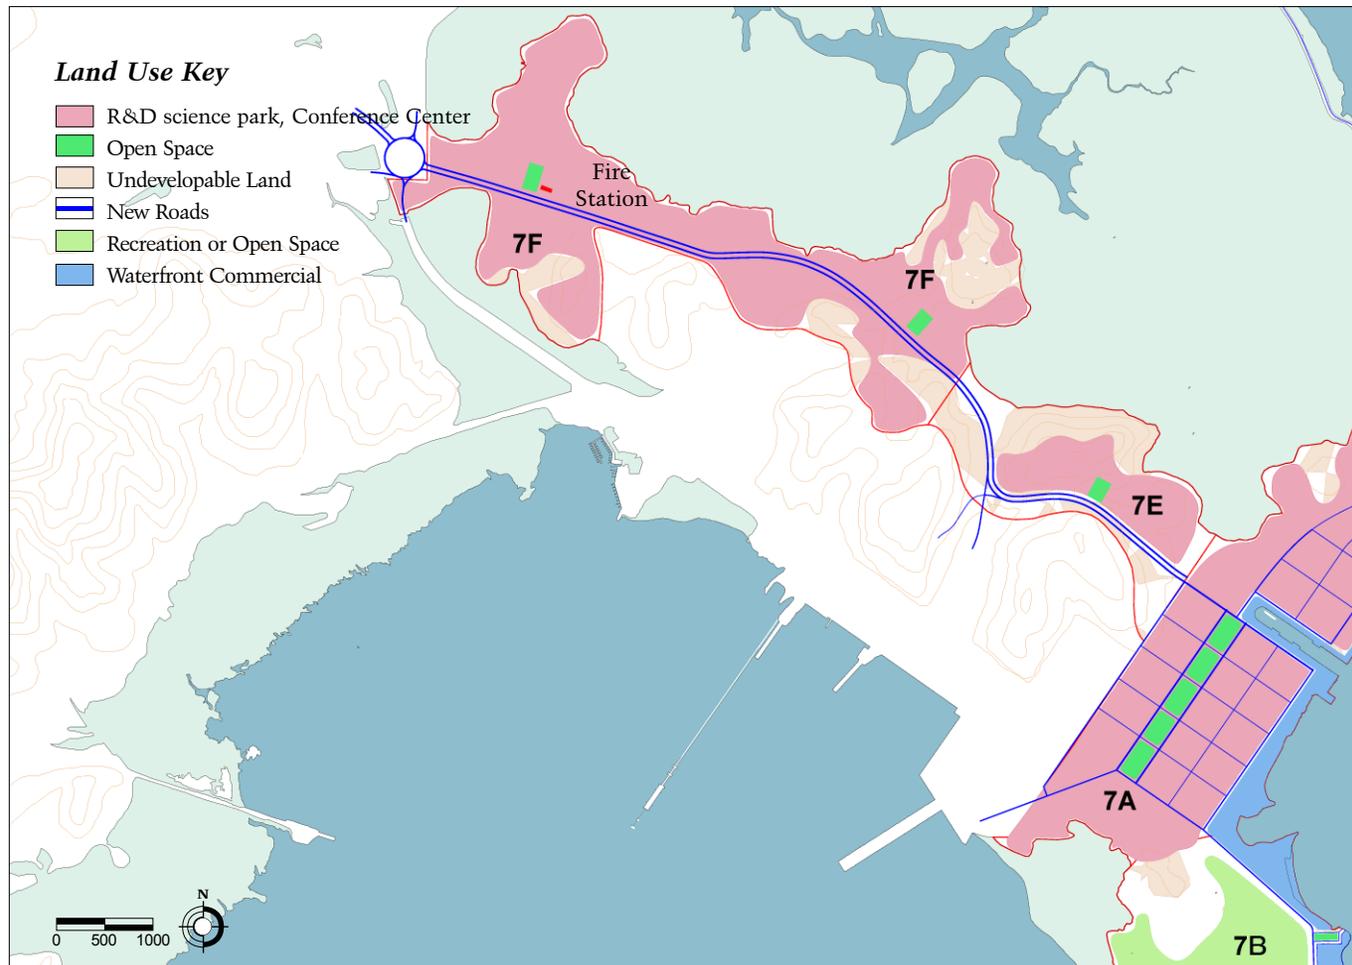

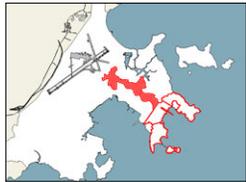

At present, the majority of land in Zone 7(N) is undeveloped. Existing development includes the Base's Fire Station (7F) and, sited at a scenic hilltop location, a former military club that is operated as a modest restaurant (7E). Together, this existing development includes 23.1 acres of the 283.2 total acres in this zone. An existing two-lane road winds along the upland northern edge of the peninsula's central ridge. Exclusive of acreage above 15% gradient, much of this remaining acreage is suitable for redevelopment, on approximately 221.3 naturally vegetated, gently sloping acres.

Existing Site Photos
 L to R:
 Camp Moscrip (7A);
 View towards Islands

Roosevelt Roads Reuse Plan

Figure V.19
Zone 7 (N)
Proposed Land Use

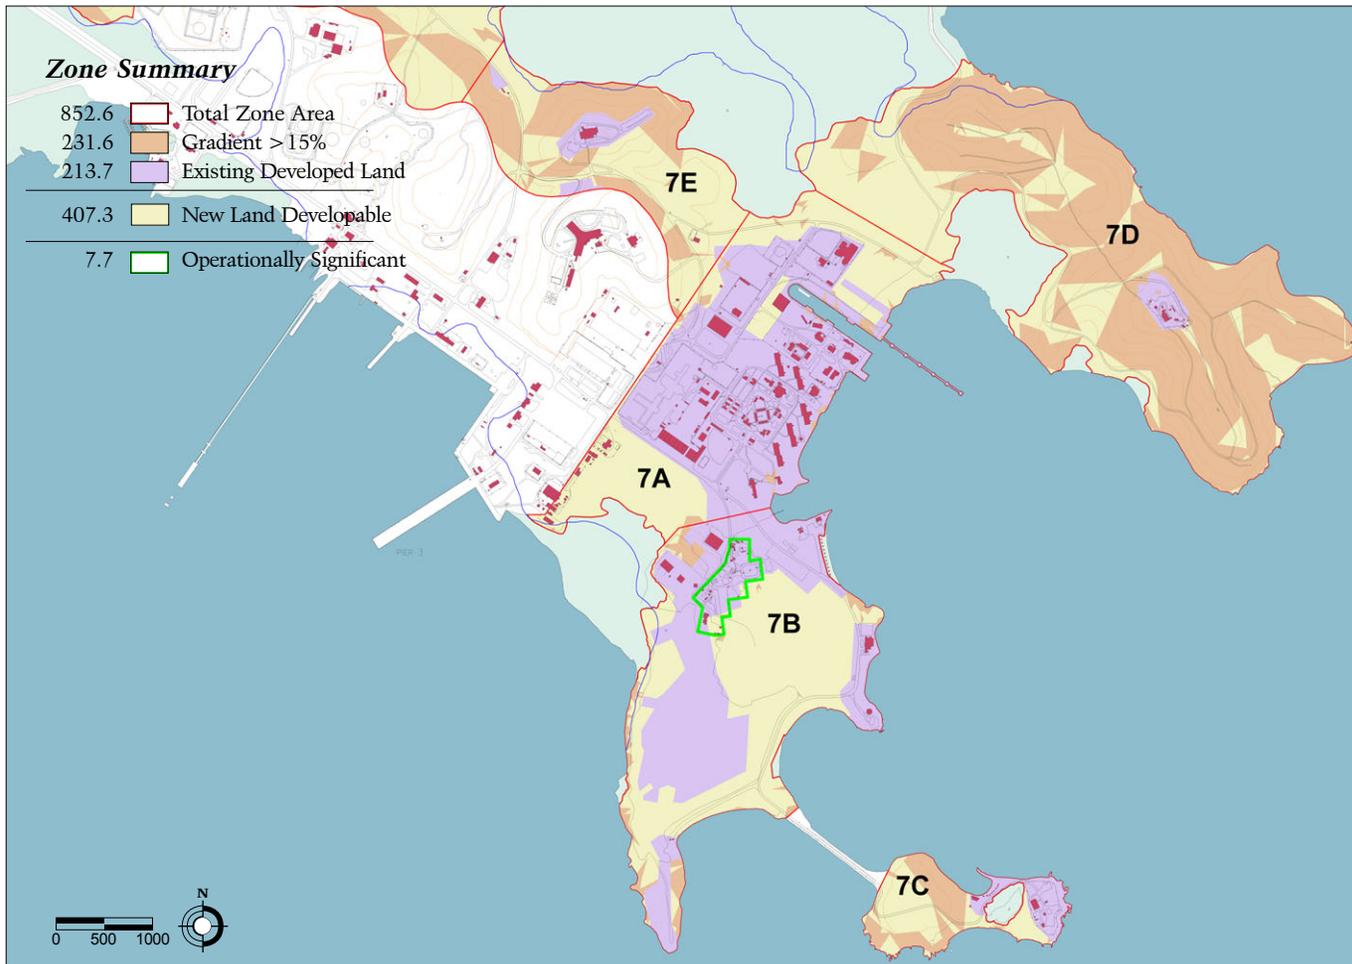

Zone 7(N) is intended as the new gateway to the proposed science park and conference center development and provides a critical linkage between the proposed university and the waterfront at the science park. An appealing naturally landscaped access road is intended to provide address for these low-density development sites that will introduce up to 1,250,000 SF of new development in multiple parcels at the inboard edge of the conservation area. A portion of the conference center, to be sited on the hilltop site (7E) will have commanding views of the mountains, islands, eastern coastline and the Base in all directions.

Proposed Precedents
L to R: Appealing Urban Landscaping (West Palm Beach, FL); Corporate Campus Image (San Mateo, CA)

Roosevelt Roads Reuse Plan

Figure V.20
Zone 7 (S)
Existing Land Use

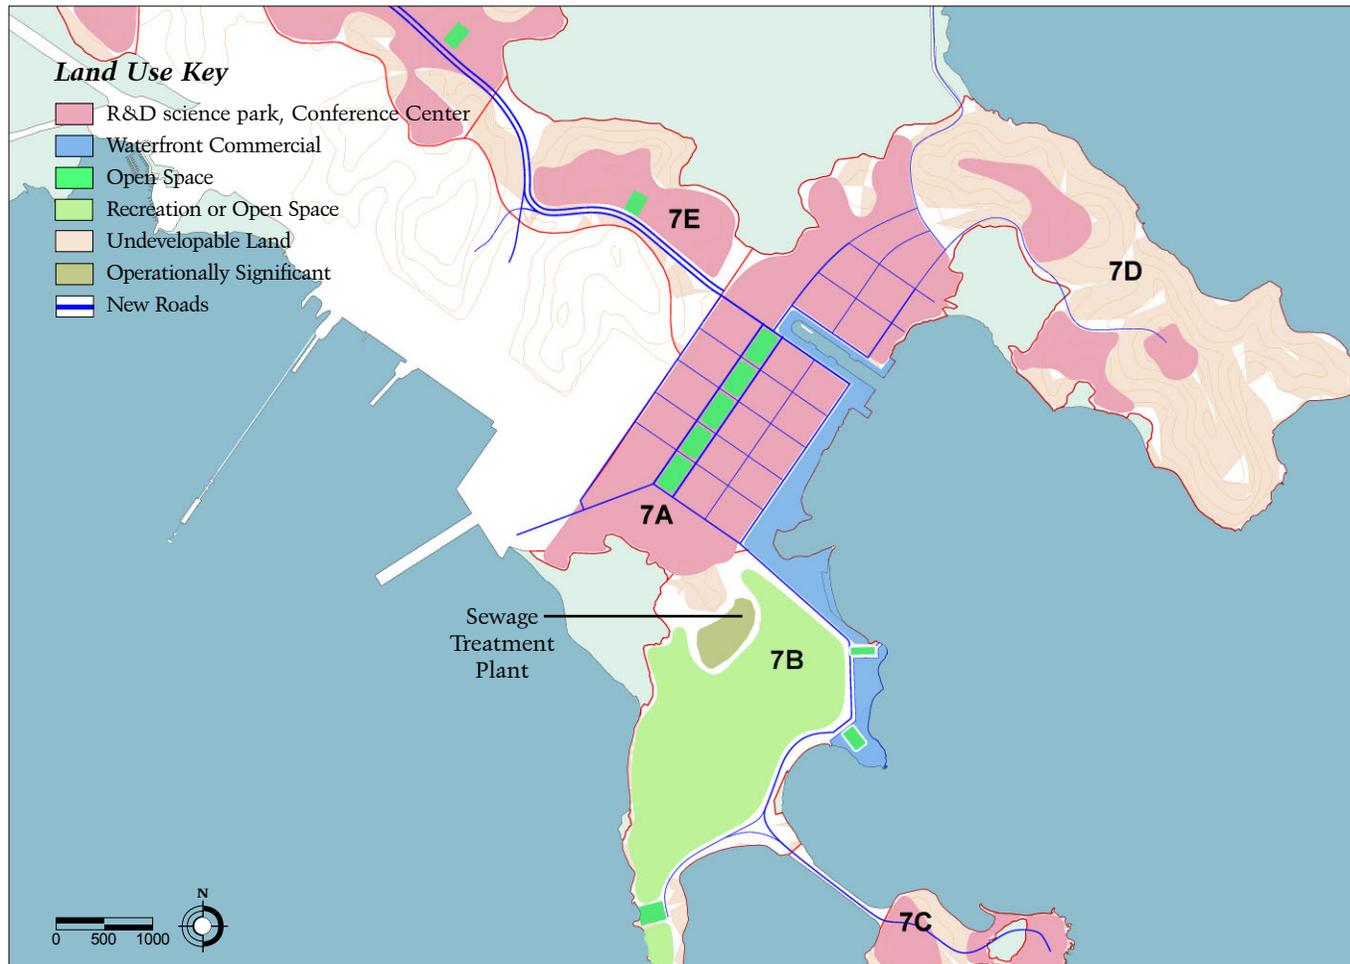

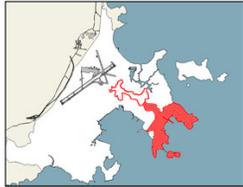

Zone 7(S) is configured in the shape of a natural horseshoe, encircling Bahia de Puerca (7A, 7B, 7C, 7D), the scenic out-board bay framed by the peninsula's central ridge and its extension through to the northern tip of the site. The 70-acre north parcel consists of upland forest and a few existing cleared development sites accessed by winding roads (7D). Steep topography and dramatic vistas over the harbor and out to the islands characterize this portion of the site. The central portion, Camp Moscrip, consists of 158.5 acres available for redevelopment with unobstructed water views (7A), level ground on bulkheaded landfill, (the result of earlier hillside excavation by the Navy) and the drama of the Navy's dry dock, now flooded. Existing development includes the USAR HQ (to be relocated), the new but never-occupied Navy Seals office building and smaller structures. A residential campus and metal storage structures dating back to WWII are loosely sited along the main roads. The southwestern acreage (7B) contains an SWMU, a former incinerator structure, and an area that the Navy used as an on-site dump. Below, a perimeter road accesses former Navy clubs and a picturesque causeway to the "boot", a hilly island with small beach along a protected cove.

Existing Site Photos
L to R: View of Flooded Dry Dock, Causeway from the "Boot" to the Base

Roosevelt Roads Reuse Plan

Figure V.21
Zone 7 (S)
Proposed Land Use

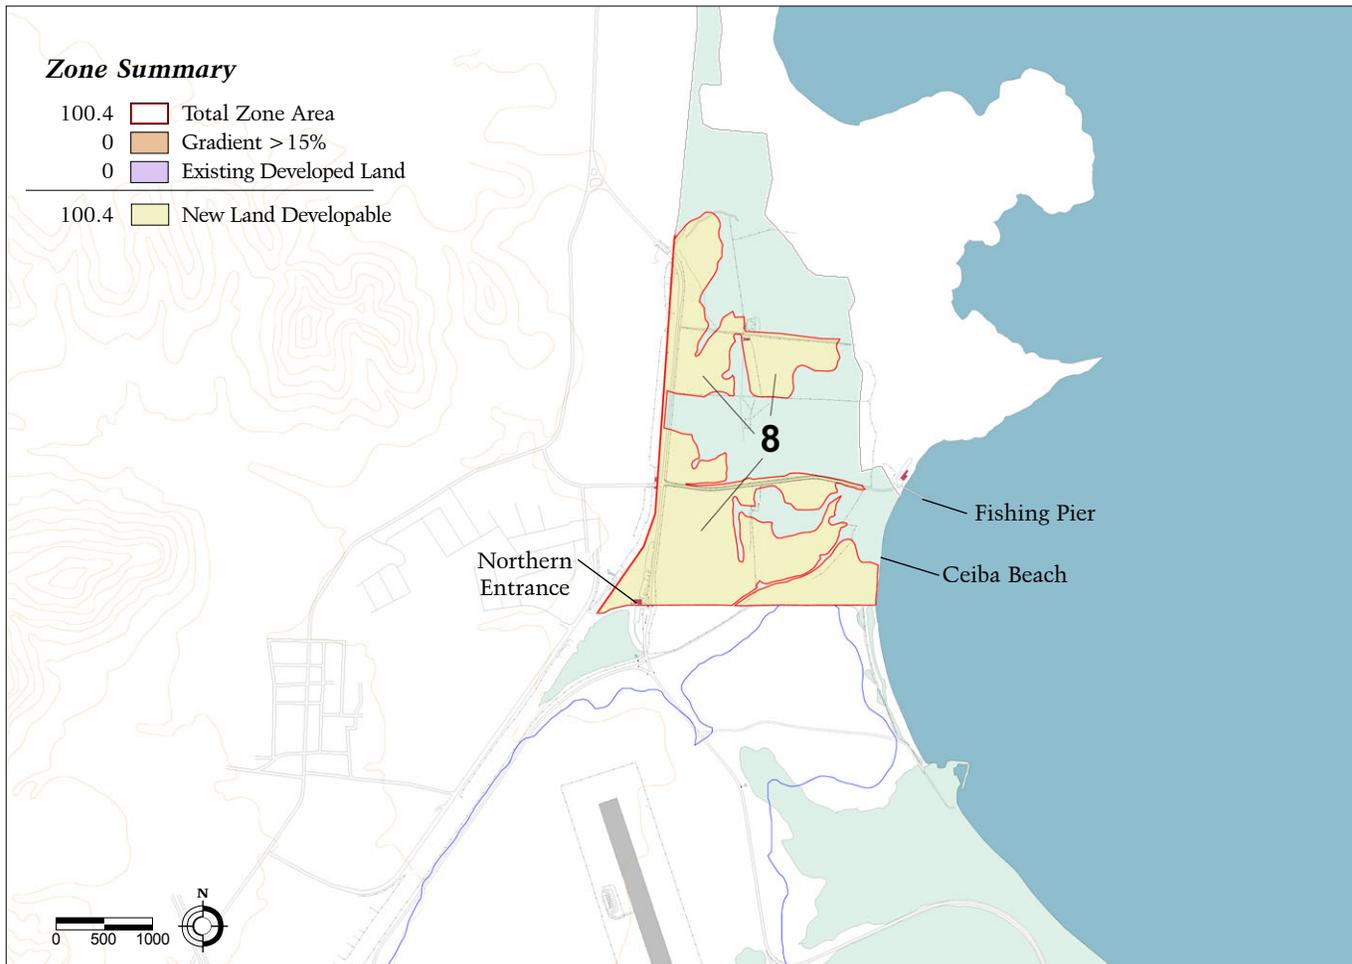

“Cabo del Norte” at Roosevelt Roads presents a unique opportunity to amenitize the economic development of the proposed science park with an “in town” pleasing and active harbor front. Infrastructure is designed to enhance a walking precinct at the waterfront, with tree-lined and lighted streets and boulevards, and landscaped paseos and plazas. A few structures in this zone could be reused to stimulate development and create early critical mass. Nearly 392 acres are available for this highly amenitized commercial, research and conference component of the proposed redevelopment of the Base. Additional supporting amenities for the science park and conference center could include active open space, passive open space, park or golf course (7B), its linkage to the proposed ferry terminal, and a small beach at the “boot” (7C). Three hill-top sites (7E, 7D and 7C) are envisioned as the location for the core lodging and meeting facilities of the proposed conference center.

Proposed Precedents
L to R: *Walking Precinct* (Palm Beach, FL);
Signature Road (Fajardo, Puerto Rico);
Mixed-Use District (Rosemary Beach, FL)

Roosevelt Roads Reuse Plan

Figure V.22
Zone 8
Existing Land Use

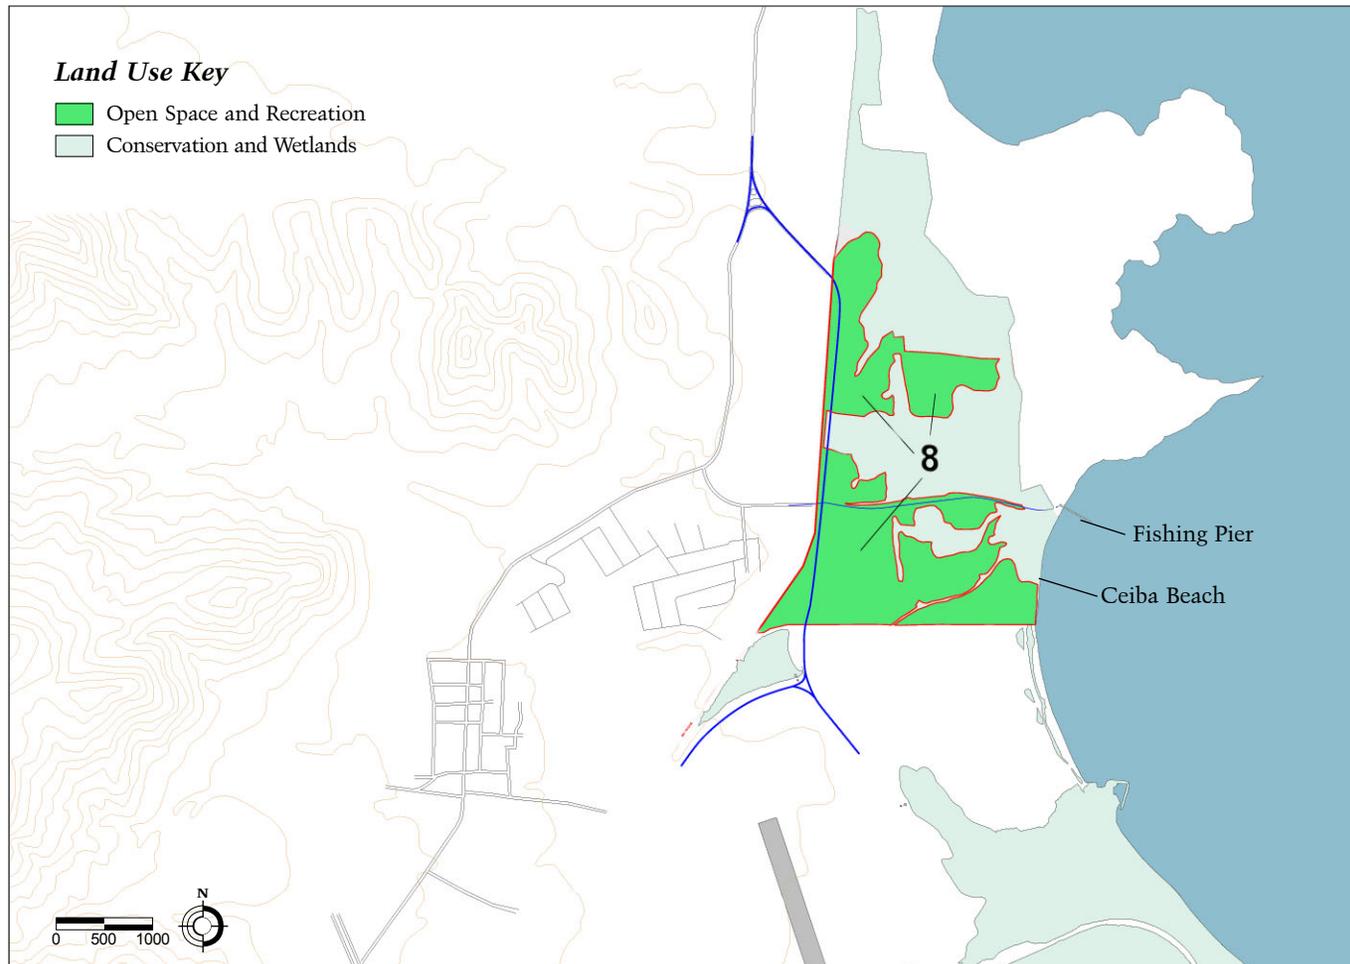

Approximately 100 acres of land beyond the north gate of Roosevelt Roads, east of its access road, consists of low-lying pastures and wetland areas. The land is adjacent to a large conservation area previously transferred to the Commonwealth's Department of Natural Resources. Publicly accessed, Ceiba Beach, the municipality's sole access to the waterfront at present, and an existing fishing pier, fish market and small boat anchorage are all located at the water's edge, at the end of an access road that bisects this zone.

Existing Site Photos
L to R: View towards El Yunque; Ceiba Beach and Small Boat Anchorage

Roosevelt Roads Reuse Plan

Figure V.23
Zone 8
Proposed Land Use

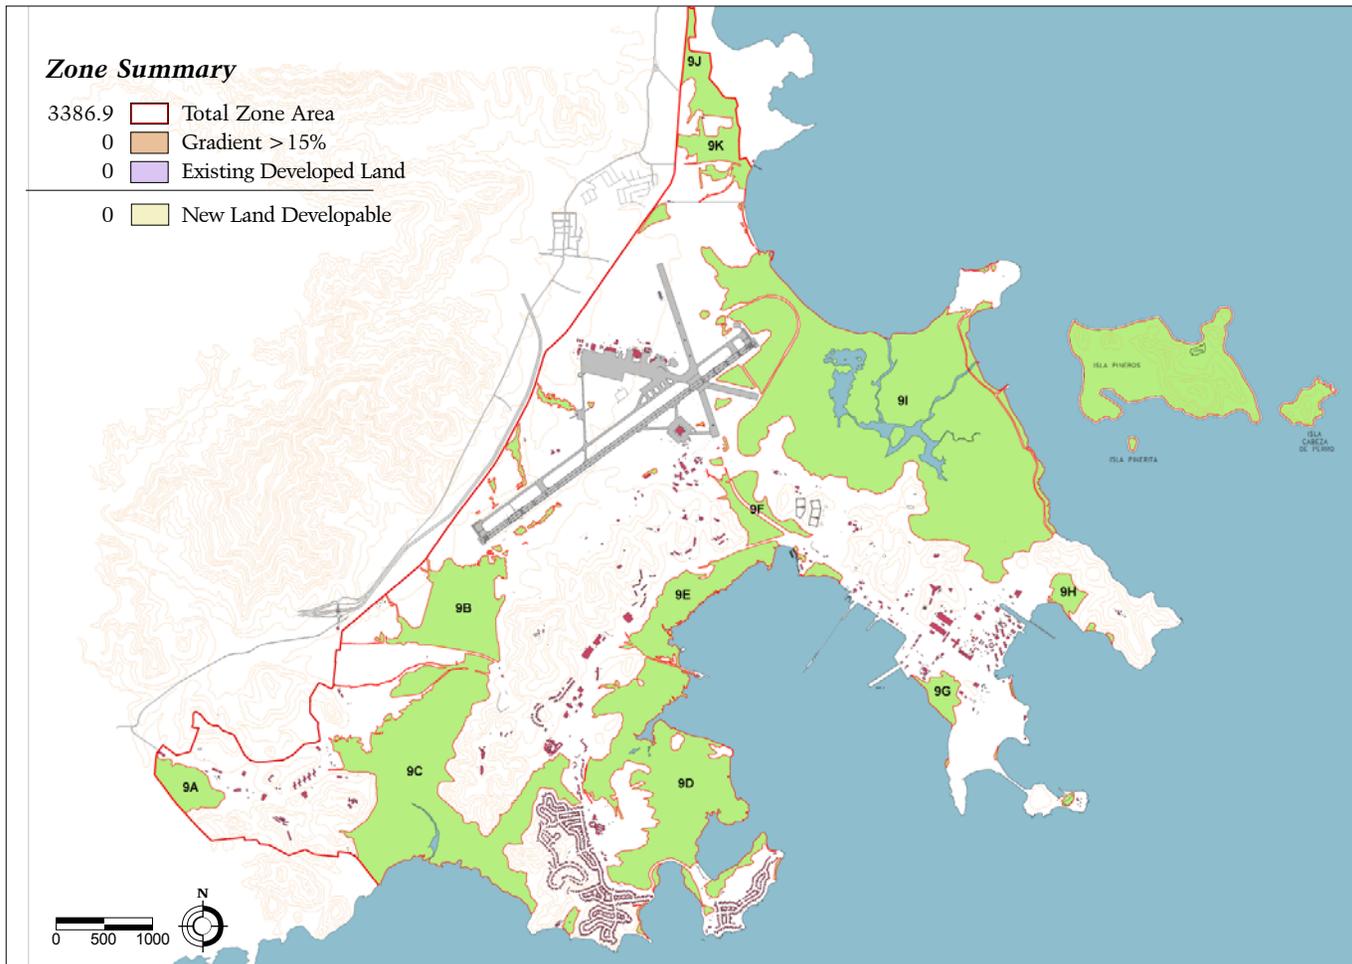

With an improved access road to Roosevelt Roads, this zone will serve as the gateway for the new development from the regional road network and those traveling south from Fajardo. Given the site's extensive wetland area and proximity to conservation areas, the recommended land use is as an open space reserve with low-impact facilities that can enhance the experience of visiting the public beach, ensuring perpetual waterfront access and recreation for the community.

Existing Site Photos

Roosevelt Roads Reuse Plan

Figure V.24
Zone 9
Existing Land Use

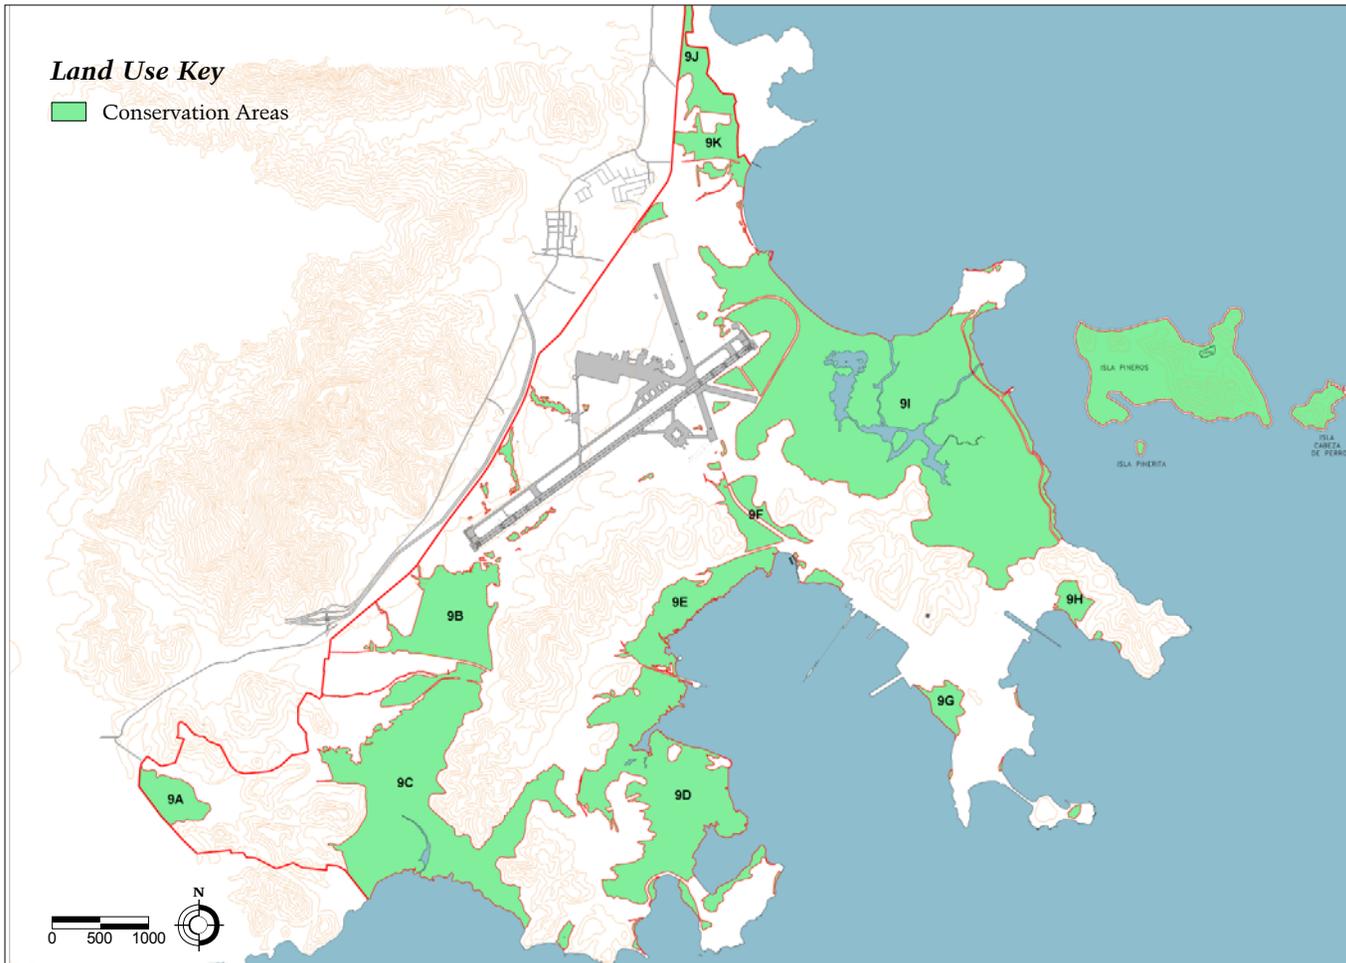

This area consists of a total of 2985.2 acres of nearly continuous undeveloped mangrove forests and wetlands on the mainland NSRR site. In addition, there are three small islands off the east coast of Punta Media Mundo including Isla Pineros with 359.6 acres; Isla Pinerita with 3.5 acres, and Cabeza de Perro with 38.6 acres. Together the mainland and islands incorporate 3386.9 available undeveloped acres.

Existing Site Photos

Roosevelt Roads Reuse Plan

Figure V.25
Zone 9
Proposed Land Use

As development in the eastern region of Puerto Rico intensifies, opportunities for conservation of significantly-sized coastal properties diminish. At NSRR, one of the largest coastal properties under single ownership in Puerto Rico, large-scale redevelopment opportunities can exist without encroachment on land suitable for conservation. Thus, the proposed land use in Zone 9 is solely conservation, thereby contributing this acreage to the on-going regional conservation initiative.

Thousands of acres of mangrove forests and adjacent wetlands at NSRR provide natural habitat to a number of threatened and endangered species. These are discussed in detail in Appendix A.

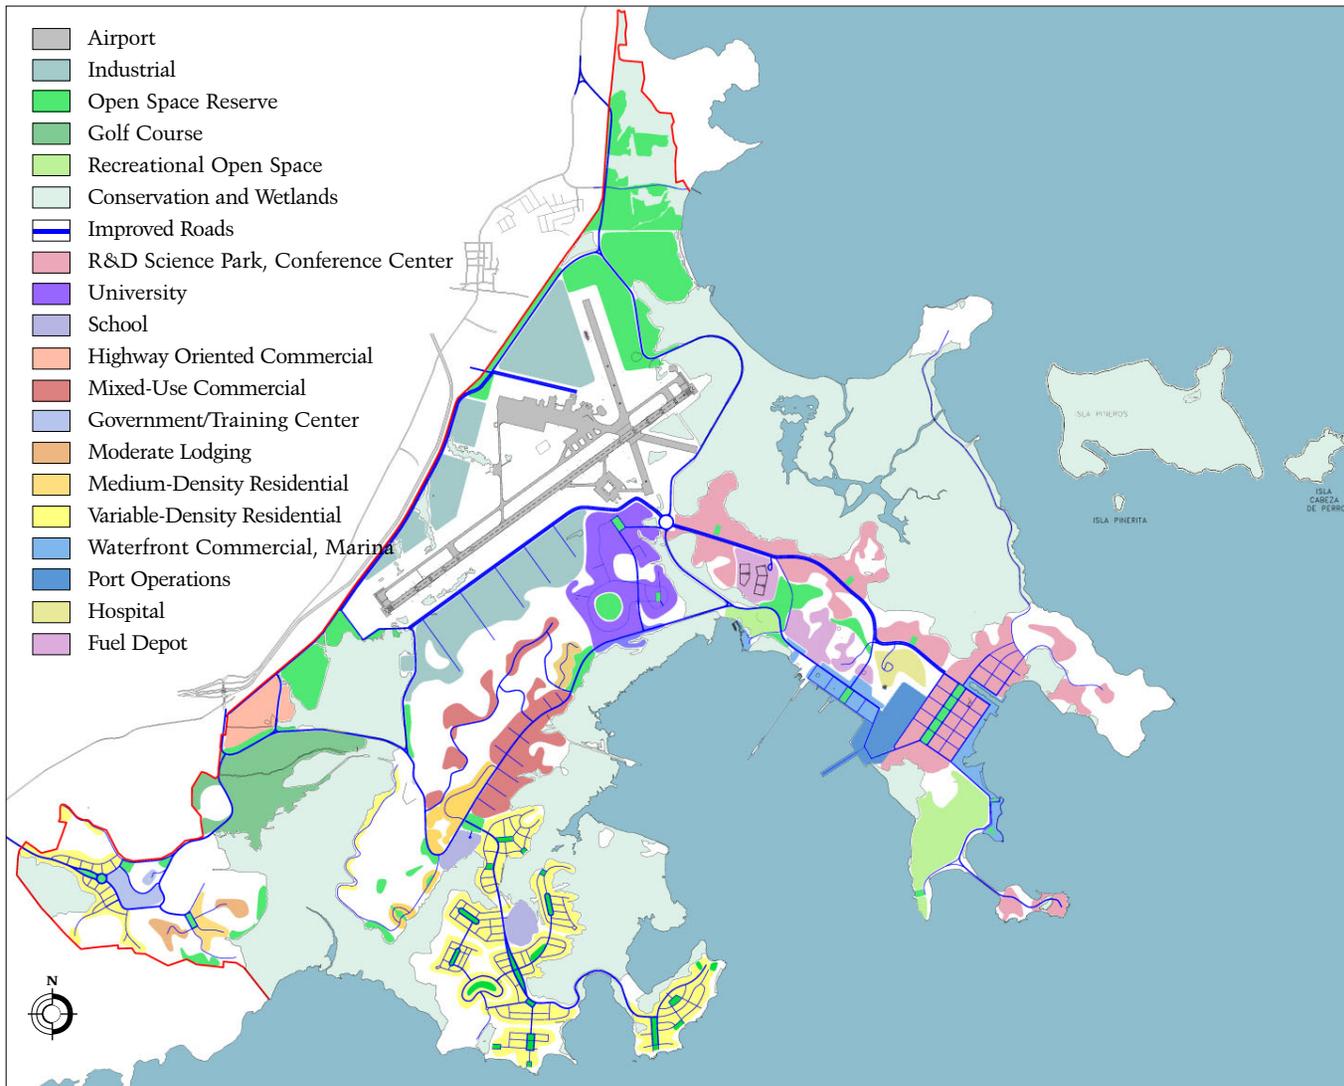

Conservation of this property will contribute immeasurably to ecological education and advance regional ecotourism and environmental protection agendas. This will enhance the value of the entire property.

Proposed Precedents:
Las Cabezas de San Juan, Conservation Trust of Puerto Rico (Fajardo, Puerto Rico)

Phasing

The redevelopment of the Base will, of course, occur in phases over many years. Accordingly, a phasing program has been prepared and is shown in Table V.3. It is, by necessity, illustrative and will vary depending on actual market conditions, availability and commitment of funding, policy decisions by the Commonwealth of Puerto Rico and by the Navy, and the level of interest and commitment by private sector developers, investors, and users.

**Table V.3
Illustrative Phasing
Program**

VI. Urban Design Framework Plan and Design Principles

This chapter presents the Consulting Team's Urban Design Framework Plan and the Design Guidelines for the NSRR Reuse Plan. This plan is the culmination of the Consulting Team's site, building, infrastructure and environmental assessments, informed and tempered by the market analysis. The LRA's aspirational goals for the Reuse Plan reflect the interests of the community and the Commonwealth. Blended together with the cumulative insights gained during the assessment phases, this is the basis for the Reuse Plan.

The Framework Plan equally embraces the opportunities and constraints that the site presents, assessed strengths and absorption rates of the market, and the range of uses that will best foster economic development within the immediate community and even accelerate growth in the region. It recognizes the availability of reusable assets, and the value of those assets in promoting economic activity at the site, particularly in the early development phase. Finally, the Framework Plan extensively uses imagery from the most relevant local and regional precedents to illustrate the range of available excellent, culturally rich, highly aesthetic development models for the Reuse Plan.

The accompanying set of illustrative plans, drawings and precedent images in this chapter describe the aspirational economic goals and design intent for each of the nine zones within the Plan. In essence, the Framework Plan demonstrates that through conscientious and thoughtful planning, the Base's redevelopment potential-and its value-will be dramatically enhanced.

Guiding the preparation are a series of Design Principles developed to articulate the defining values embraced by the NSRR Reuse Plan. Each of these is fundamental to the Framework Plan. In addition, preliminary concepts for building heights, setback and density have been identified to inform the underlying zoning process undertaken by the Planning Board.

Design Principles

A series of Design Principles were developed to articulate the defining values that have guided the preparation of the NSRR Reuse Plan. Each of these is fundamental to the Framework Plan; the order of these is neutral to emphasize the equal importance of each.

1. Generate high-level employment through development of a world-class science and research park consistent with the objective of fostering corporate investment of intellectual capital in the region.

Roosevelt Roads Reuse Plan

2. Maintain, secure and enhance the value of airport and port operations for passenger and cargo transportation, as well as commerce, recreational and tourism use at the site.
3. Maximize the community and the public's access and enjoyment of the site's waterfront for commerce, recreational, educational and residential use.
4. Encourage lively and vibrant placemaking through multiple and mixed land uses and compatible streetscape and open space.
5. Enhance site access and visibility, through the creation of multiple signature entrances to the redevelopment and through well-designed, phased, compatible infrastructure improvements.
6. Encourage integration of sustainable development principles wherever possible. Encourage climate-responsive structures, capitalizing on solar, wind and view orientation while simultaneously reducing energy-dependent construction.
7. Reuse significant existing facilities without limiting the quality and possibilities for future development.
8. Conserve and enhance the site's undeveloped coastal ecosystem through informed stewardship that will provide limited access, sustainable opportunity for educational benefit to the people of Puerto Rico, and contribution to the broader regional eco-initiatives.
9. Create new sustainable residential neighborhoods supported by appropriate recreational, educational and neighborhood-scale retail amenities.
10. Enhance the redevelopment of the Base with design standards that will guide development toward regionally time-tested and climate-appropriate character defining details that are materially practical, sustainable and aesthetically complementary, such as roof overhangs, shaded verandas, balconies, louvers and jalousie windows, cooling planted courtyards and atria.

The Framework Plan for the reuse of Naval Station Roosevelt Roads proposes and illustrates a sensitive, restrained and balanced approach to development. Reuse and development is intended to preserve vital natural habitat while simultaneously supporting significant economic growth across many sectors, including commercial, research and development, industrial, residential, tourism, institutional, educational, recreational and retail. The plan proposes ecologically-sensitive areas to be protected, yet accessible and instructive. Developed waterfronts that are not part of Conservation Areas will be made publicly accessible, supporting recreational, tourist and port activities. The redevelopment proposes to balance natural terrain (e.g., Conservation Areas), cultivated terrain (e.g., landscaped open space reserves) and developed terrain (e.g., commercial, mixed-use and residential neighborhoods).

Vast proposed conservation areas will link and define a series of distinctive neighborhoods. Landscaped public spaces (such as parks, boulevards and squares) create identifiable neighborhood addresses, each with a distinct character drawn from topography, views and projected uses. The distinctive character and setting of each neighborhood is supported by the wide range of institutional uses distributed among the neighborhoods. These include a medical center, university campus, airport, training facility and schools.

The neighborhoods are also distinguished through differing scales of construction. For example, a low- and medium-density residential neighborhood with gardens and yards will differ from the livelier Downtown zone. A variety of uses that contribute to a vibrant community—one that has an activated streetscape on weekdays, evenings and weekends—is encouraged in certain neighborhoods such as Downtown, or the Harbor District and the science park—amenitized by water views. All neighborhoods are based on pedestrian-friendly streets with sidewalks, interconnected by roads with separate bicycle and jogging paths.

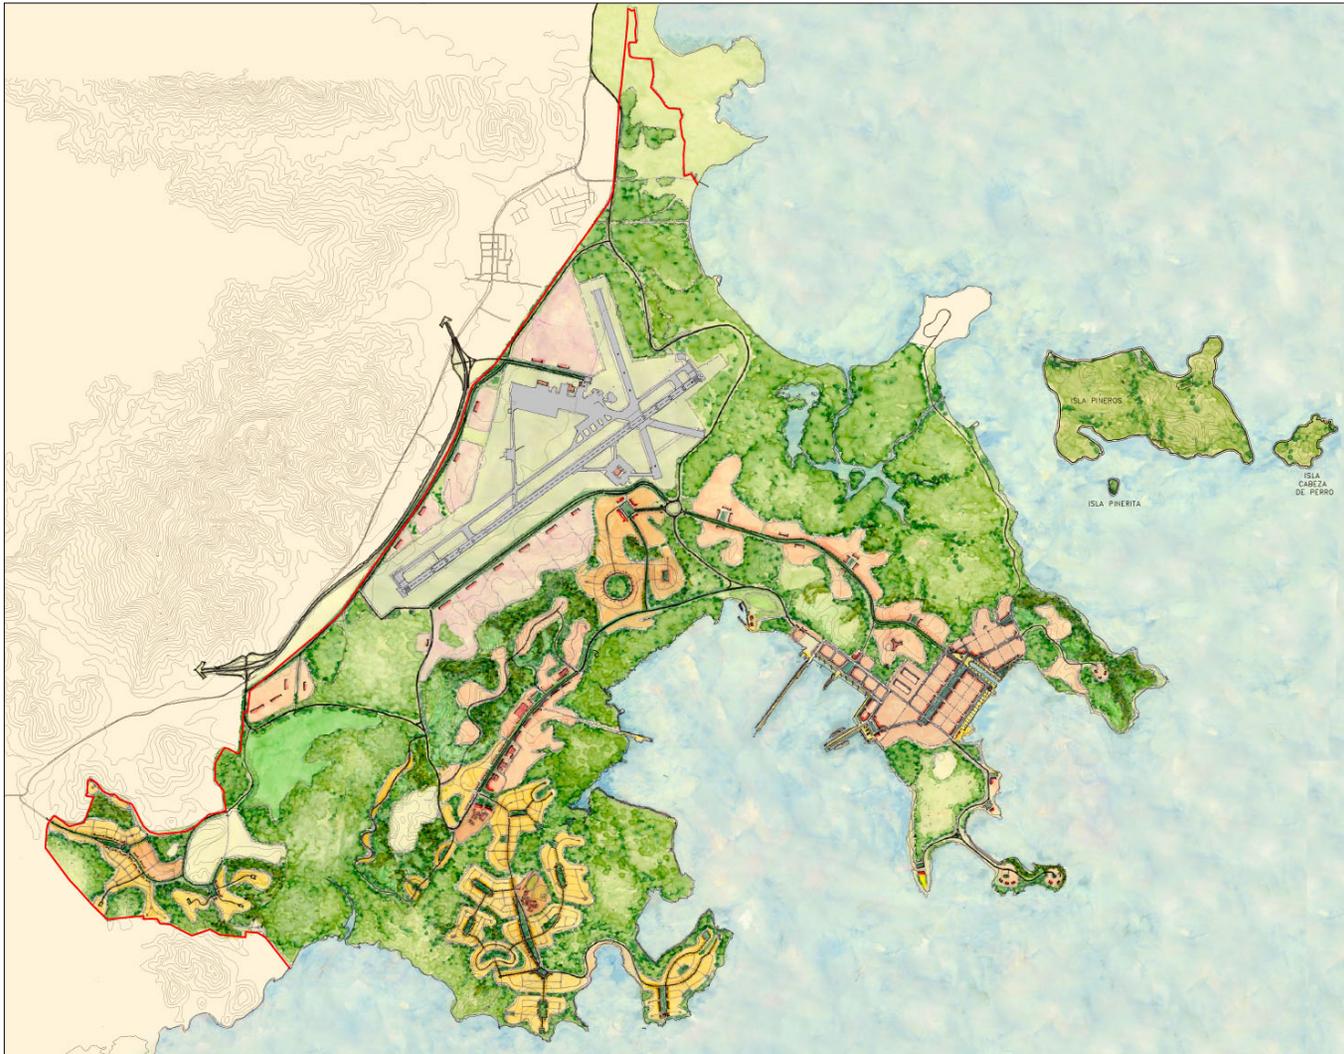

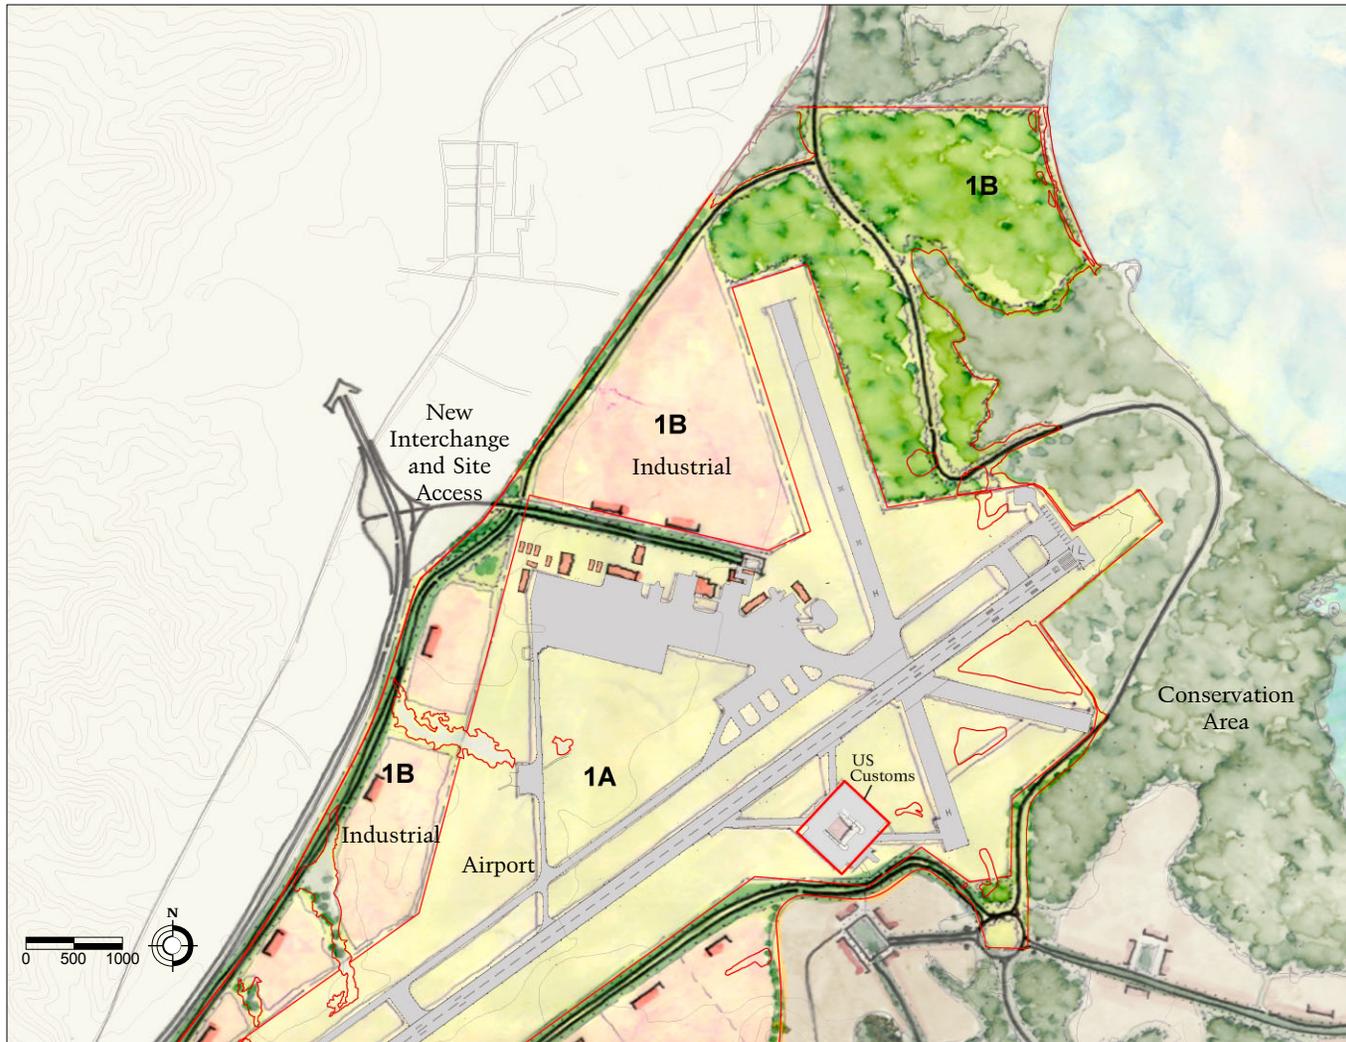

Figure VI.1
*Composite Illustrative
Rendering*

Places with a distinct, lively and well-maintained character attract people and activity. Strolling along a working waterfront, dining outdoors among shady, decoratively lighted trees; studying in a laboratory with views of both sea and mountains; kayaking through sea grass and mangroves—these and many more memorable and unique experiences are waiting to be created here in Puerto Rico.

Framework Plan by Zone

Figure VI.1
Zone 1 (N)

Zone 1 (N) General:
Zone 1 will serve as the “front door” to much of the redevelopment area and demands signature landscaping and well-defined roadways with lighting and wayfinding and easily accessible parking. Developable land immediately surrounding the Airfield will be redeveloped for transportation-dependent industrial uses. These are bracketed to the northeast and southwest by open space reserves within the Airport’s flight path noise zone.

Roosevelt Roads Reuse Plan

Zone 1 (N):

Precedents:

L to R: International Trade Center (Cranbury, NJ); Palm-Lined Boulevard (Los Angeles, CA)

Zone 1A: Airport: A new highway interchange will establish a distinctively-landscaped gateway to the airport and industrial areas, relieving pressure from the circuitous road from the Northern Entrance through the Conservation Area. A boulevard lined with palm trees and contemporary decorative lighting leads to the terminal area.

Figure VI.2
Zone 1 (S)

Zone 1(S) General Description: The Southern Entrance serves the redevelopment and the larger community with highway-oriented commercial development. The large, relatively low industrial buildings of this zone will sit behind well-landscaped and maintained setbacks along the roads.

Roosevelt Roads Reuse Plan

Zone 1(S) Industrial

Precedents:

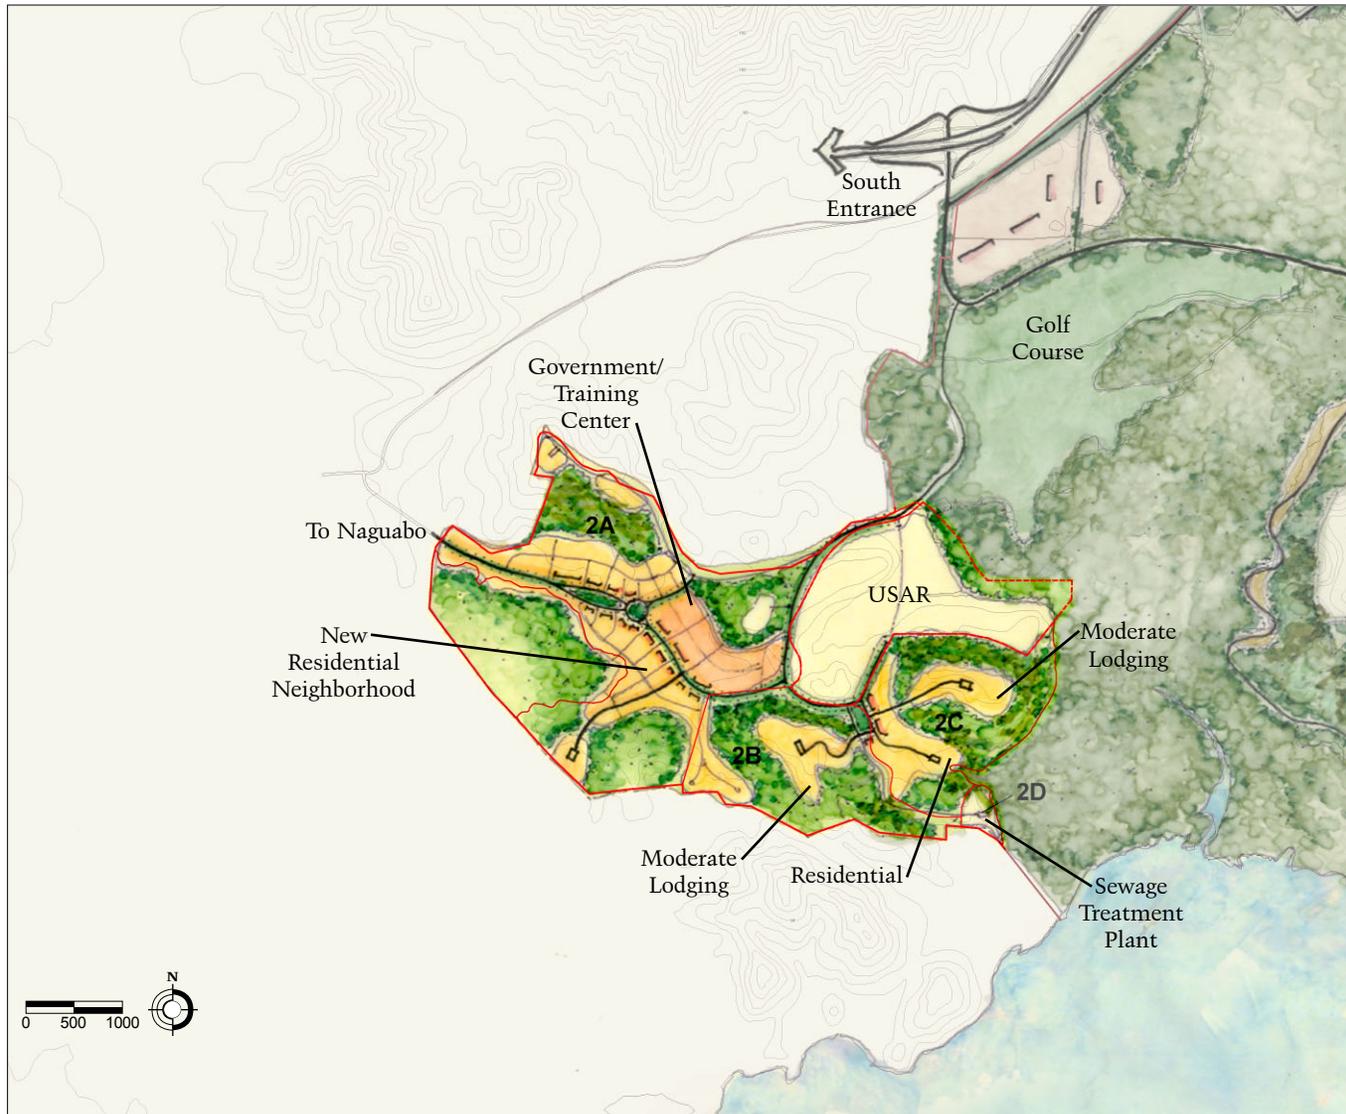

All Images:
International Trade
Center (Cranbury, NJ)

Zone 1B: Industrial & Southern Entrance:

- *Industrial:* Serviced by multi-modal transportation, these large parcels will be ideal for high-value, international manufacturing, assembly, and distribution uses. Generous landscaped roads will provide signature addresses to each site, including the airport terminal boulevard, the boulevard parallel to the highway, and the southern boulevard, visually screened from the airport with well-designed landscaping.
- *Southern Entrance:* The existing highway interchange makes this location very convenient both to Roosevelt Roads users as well as neighboring communities. It is envisioned as a regional shopping and commercial center, whose position as main gateway to the residential and Downtown commercial uses demands a high level of design and maintenance for landscape, buildings, signage and roads. For example, a well-landscaped open space area across from the existing golf course (Zone 3A) complements the desirable image en route to Downtown, the schools, new residential neighborhoods and the university campus.

Figure VI.3
Zone 2

Zone 2 General: Within a hilly landscape, a range of low-intensity uses forms clusters of development activity at the southwestern end of Roosevelt Roads. Accessed through and amenitized by the expanded golf course, these neighborhoods will feel quite distinct, surrounded largely by wetlands and undevelopable slopes. A maximum of three stories in height, the buildings in this zone will benefit from utilizing broad overhangs and careful orientation to create climate-responsive homes and facilities. Using traditional and distinctive Spanish Colonial and Caribbean architectural elements reduces energy consumption and promotes sustainability and cohesive neighborhoods.

Roosevelt Roads Reuse Plan

Zone 2: Government/ Training Center and Residential Precedents:

Clockwise from Top Left:
Spanish Revival Home
(Palm Beach, FL);
Private House
(Rosemary Beach, FL);
Existing Views from Site
(NSRR, Puerto Rico);
Residential Street
(Key West, FL);
Private House
(Seaside, FL);
Private House
(Rosemary Beach, FL)

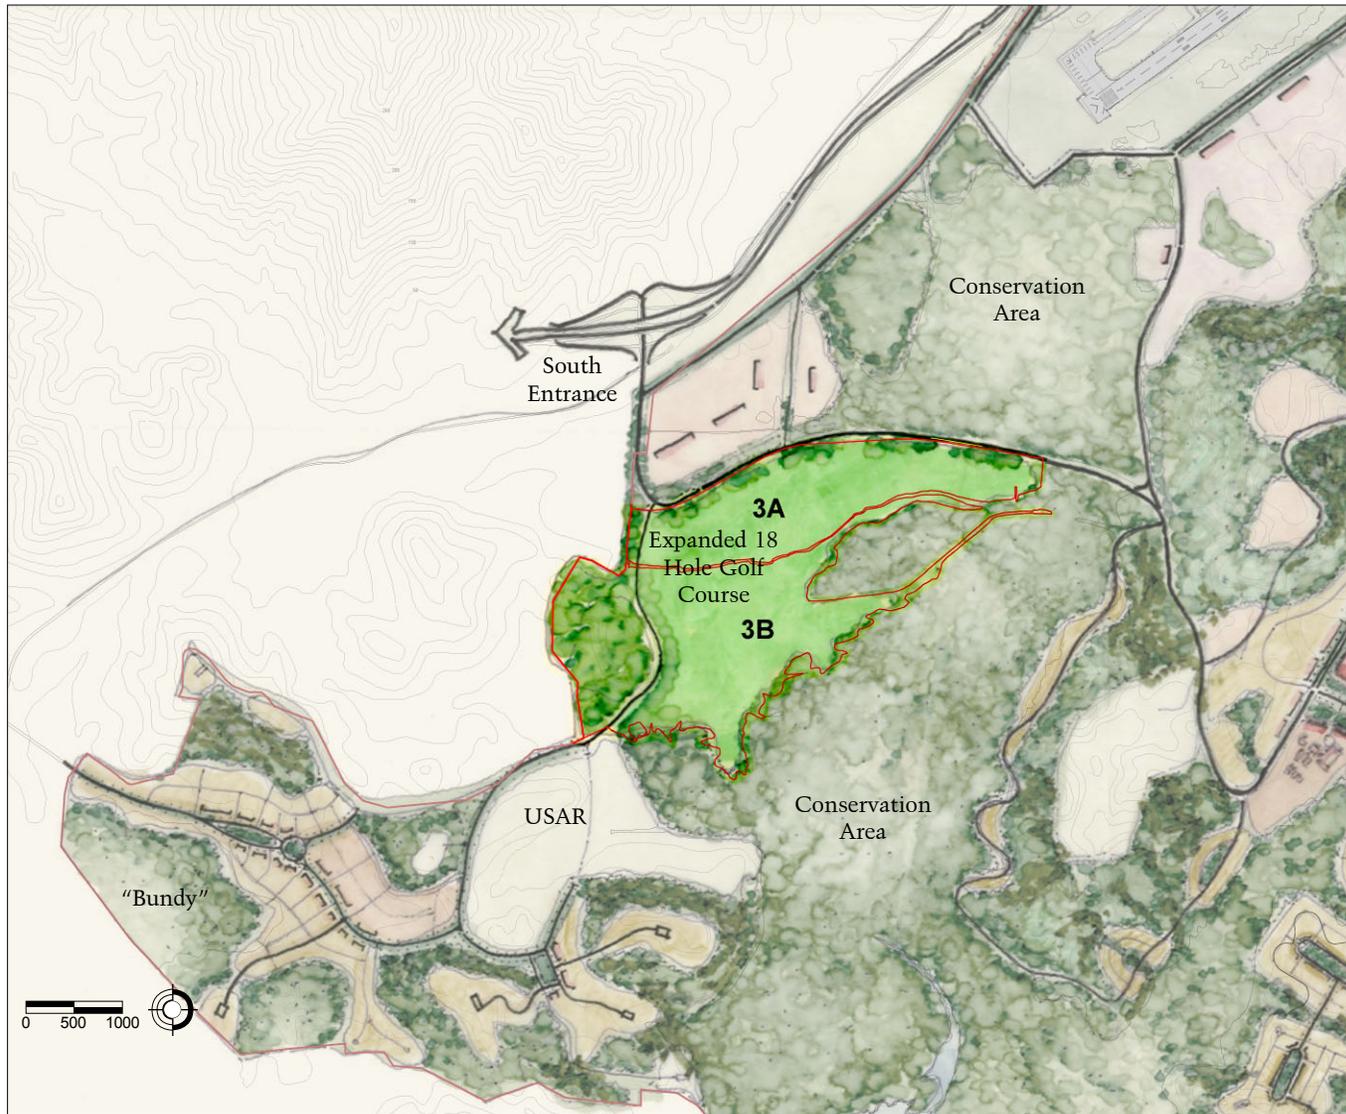

Zone 2A: Government/Training Center and Variable-Density Residential: Gently curving tree-lined streets with pockets of park-like landscaping characterize this precinct. Public open spaces and sidewalks throughout encourage front-porch living and neighborliness. Front yards with consistent setbacks are suitable for children's play, separated from traffic by on-street parking and planting areas.

Zone 2B: Moderate Lodging: This hilltop site reached through a landscaped square makes a memorable spot to spend a day or two of work-related travel or a week to two of vacation. Compact development will capitalize on fantastic views of El Yunque, sweeping Conservation Areas and the water while creating a distinct campus.

Zone 2C: Medium-Density Residential and Moderate Lodging: Smaller, more affordable lots share a generous public square for outdoor leisure activities. While secluded and free from through traffic, open spaces and sidewalks encourage front-porch living and neighborliness. The hilltop to the northeast provides another great lodging location in a compact, site-responsive configuration.

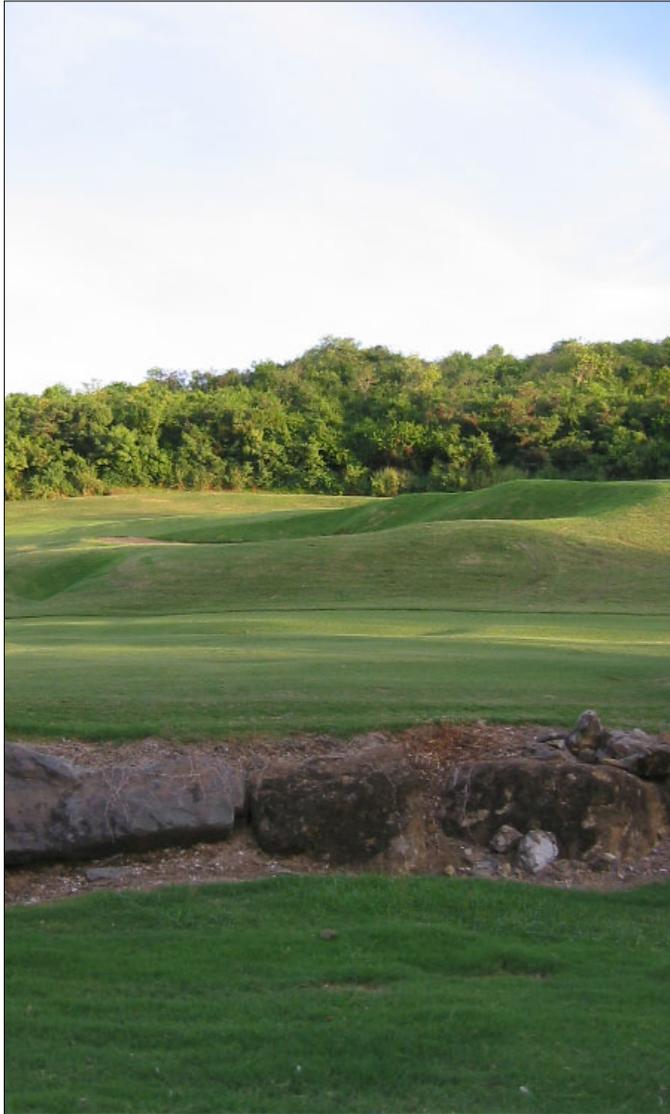

Figure VI.4
Zone 3

General: Just inside the Southern Entrance of Roosevelt Roads, the existing 9-hole golf course (3A) is expanded and re-engineered to a full 18-hole public course (3A, 3B). Bordering on a large Conservation Area, this public recreational zone contributes to the redevelopment's restrained balance of natural terrain, cultivated terrain and developed terrain.

Roosevelt Roads Reuse Plan

Zone 3: Golf Course
Precedents:
Golf Courses in
Puerto Rico

Roosevelt Roads Reuse Plan

Figure VI.5
Zone 4 (N)

General: The foothills of the Delicias Hills frame the neighborhoods of Zone 4, creating a vibrant mixed-use district at the center of Roosevelt Roads. This lively “Downtown” is bracketed by the University campus to its north and low- to medium-density residential uses to the south, conveniently adjacent to a middle/high school. Views to Ensenada Honda and El Yunque from the development sites at higher elevations could have significant appeal.

Roosevelt Roads Reuse Plan

**Zone 4 (N):
University and
Lodging Precedents:**
Clockwise from Top Left:
*Cityplace (Dallas, TX);
Marbella Club
Condominiums at
Palmas del Mar
(Humacao, Puerto Rico);
Old San Juan
(San Juan, Puerto Rico);
El Convento Hotel
(San Juan, Puerto Rico)*

Zone 4E: Moderate Lodging, Open Space and Mixed-Use Commercial: An open space reserve terminates the Downtown boulevard as a green punctuation mark. Just up the hill is a newly-constructed multi-family lodging or potential residential site that leads right into the lively Downtown core. Farther up the hill is another opportunity for a mix of uses with magnificent views (see Zone 4B, Figure VI.5).

Zone 4F: University Research Campus: At the nexus between the airport, industrial, Downtown, and science park precincts is the University Research Campus. The Campus will advantageously draw on many aspects of its location in curriculum planning (including wetlands ecology, marine biology, aviation and nautical engineering) as well as burgeoning industries—especially pharmaceutical and bioscience—that are growing in Puerto Rico. The location is well connected to road, air and water transportation and convenient to housing, commercial, industrial and recreational uses. Three major open spaces organize the campus settings: the “Cuadrángulo Mayor” near the airport, the hilltop “Loma” near Downtown and the “Plaza Académica” to the east. The Cuadrángulo Mayor will anchor the first phase of the Campus, linked by a stately boulevard to the proposed new traffic circle to the east. Later expansion will encircle the Loma while the Plaza Académica could be the center of on-campus residential life and a new water view faculty row.

Figure VI.6
Zone 4 (S)

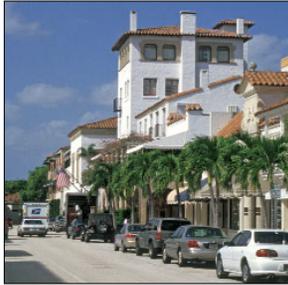

Zone 4 (S) General:
 “Downtown” includes a dedicated open space reserve, a public school, mixed commercial uses, moderate lodging and medium-density residential development. This urban-style blend of uses is served by an urban boulevard with sidewalks and four rows of trees framing divided traffic lanes. Where it creates a greater diversity of occupation, development up to three stories high is appropriate in Downtown with four-story elements for architectural expression at appropriate corners. However, ridgeline development should not exceed three stories. In general, development should line streets closely with well-landscaped setbacks. Most off-street parking should be located behind new development with only token short-term convenience parking in front, enabling the development of frontage buildings of the scale appropriate to Main Street commercial and retail districts.

Roosevelt Roads Reuse Plan

Zone 4 (S): Medium Density Residential and Mixed-Use Commercial Precedents:

Clockwise from Top Left: Cityplace (West Palm Beach, FL); Santana Row (San Jose, CA); University Avenue (Palo Alto, CA); Truman Annex (Key West, FL); Plaza (San Juan, Puerto Rico)

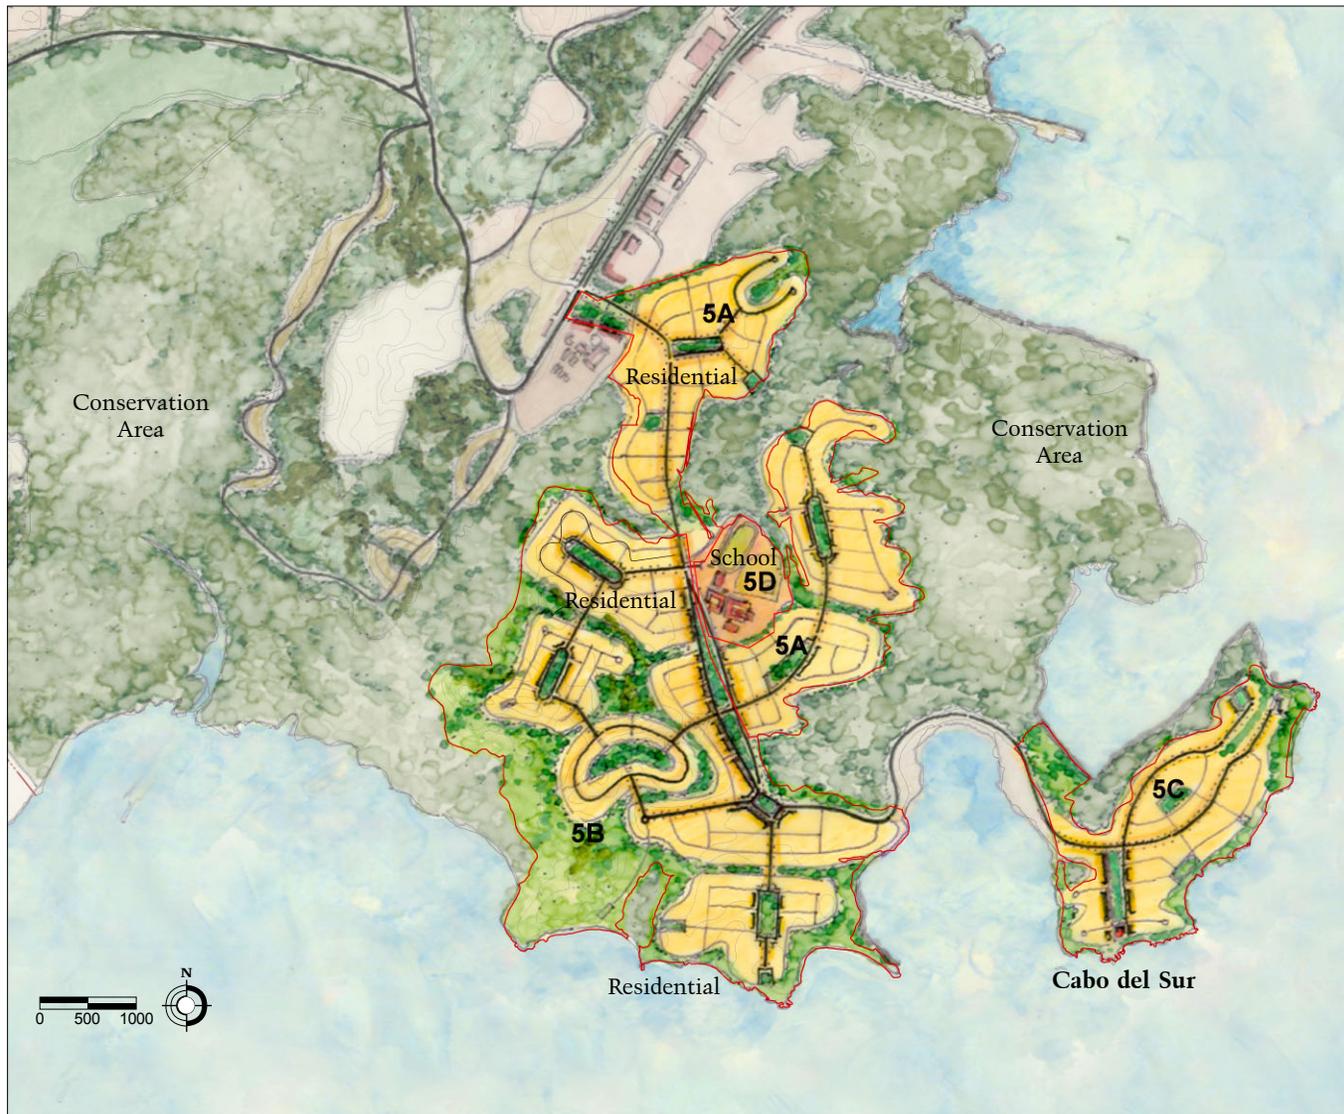

Zone 4A: Low- and Medium-Density Residential: Climate- and site-responsive homes nestle at the base of the hill following the curving topography of the tropical wetlands and will have expansive views to the mountains. To the northwest, one and two-story single-family homes hug the road and are therefore low-slung with deep verandahs to shade the afternoon sun, maintaining a rural character. The southeast sites allow clustered medium-density homes up to three stories high encircling landscaped gardens and recreational open spaces. Sidewalks in developed areas connect to bike paths leading to downtown shops, services and the public school.

Zone 4B: Mixed-Use Commercial: These ridgeline sites have fantastic views both towards El Yunque and the harbor. Possible uses include small-scale commercial enterprises and medium-density housing, up to three stories maximum in any case. Compact development patterns should be used here rather than low-intensity “carpet” development, particularly due to irregularly-shaped and fragmented site configuration.

Zone 4C: Medium-Density Residential: Nestled around the foothills, these parcels are within walking distance of both the public school and Downtown commercial activity. Slopes and lot configurations should encourage a variety of more compact and affordable housing typologies, such as walk-up flats and duplexes.

Zone 4D: Downtown Mixed-Use Commercial: Framing a beautiful palm-lined boulevard, the commercial core of Roosevelt Roads presents an opportunity to create a pedestrian environment—a “park once and walk” area. Bringing new development toward the street and placing parking behind is essential to creating a cohesive scale and frontage and a distinctive, true downtown environment. The fairly level terrain and potential for mixed commercial, retail, restaurant and residential uses can create a vibrant place with complementary daytime, evening and weekend uses.

Figure VI.7
Zone 5

Zone 5 General:
 “Cabo del Sur,” the southern stretch of Roosevelt Roads, provides a variety of low-density homesites, from hillside aeries to wetlands-adjacent parcels to waterfront lots. Each neighborhood is centered on one or more landscaped public open spaces linked by tree-lined streets. In this scenario, the NSRR high school is reused as a private bilingual academy. In general, two and a half stories should be the maximum height for single family homes with selected three-story buildings and higher elements in prominent locations. School development may have up to three stories. The buildings in this zone will utilize the tradition of overhangs and green, planted courtyards for shading and cooling, and careful orientation to create climate-responsive homes and facilities with a distinctively Caribbean character. Significant open space in this zone will provide a range of neighborhood recreational opportunities and waterfront amenities.

Roosevelt Roads Reuse Plan

Zone 5: Variable-Density Residential Precedents:

Clockwise from Top Left:
Residential Courtyard
(San Jose, CA);
Residential Street (Key
West, FL); Private
Residence (Vieques,
Puerto Rico);
Private Residence
(Vieques, Puerto Rico);
Front Garden
(Key West, FL)

Zones 5A, 5B & 5C: Variable-Density Residential: Each neighborhood provides a variety of lot types and sizes. Primary residential streets traverse each neighborhood, linking their parks/open spaces and frequently leading to pocket parks and overlooks at their termini. These landscaped spaces and sidewalks throughout encourage front-porch living and neighborliness. Front yards are suitable for children's play, separated from primary street traffic by on-street parking and planting areas. Sidewalks and bike paths link the neighborhoods to Downtown and the public school.

Zone 5D: Private Bilingual Academy: The former US Navy high school is given a second life as a bilingual academy

Figure VI.8
Zone 6

Zone 6 General: A very active industrial area during the Navy's tenure, this zone has the potential to be a great waterfront district, including recreational opportunities, restaurants and ferry services alongside working port and industrial uses. Quality commercial streets with trees, sidewalks and on-street parking will serve all of these uses well, creating an appealing tourist destination. Every opportunity must be taken to create a broad, hardscaped path along the water that can be used both for work and leisure, giving everyone access to the waterfront. The existing hilltop medical facility will be reused by the wider community. Where it creates a greater diversity of occupation, development up to three stories high is appropriate in waterside areas of Zone 6, always however preserving or framing view corridors.

Roosevelt Roads Reuse Plan

Zone 6: Commercial Waterfront/Marina Precedents:

Clockwise from Top Left:
Waterfront Cafe (Fire Island, NY); Marina (Puerto del Rey, Puerto Rico); Waterfront Esplanade (San Diego, CA); Mixed-Use Building (Cape Town, South Africa); Victoria and Albert Waterfront (Cape Town, South Africa)

Zone 6A: Fuel Depot and Open Space Reserve: Existing fuel storage and delivery facilities will remain. The developable terrain between and around them will be dedicated as open space and planted to provide screening of the fuel depot.

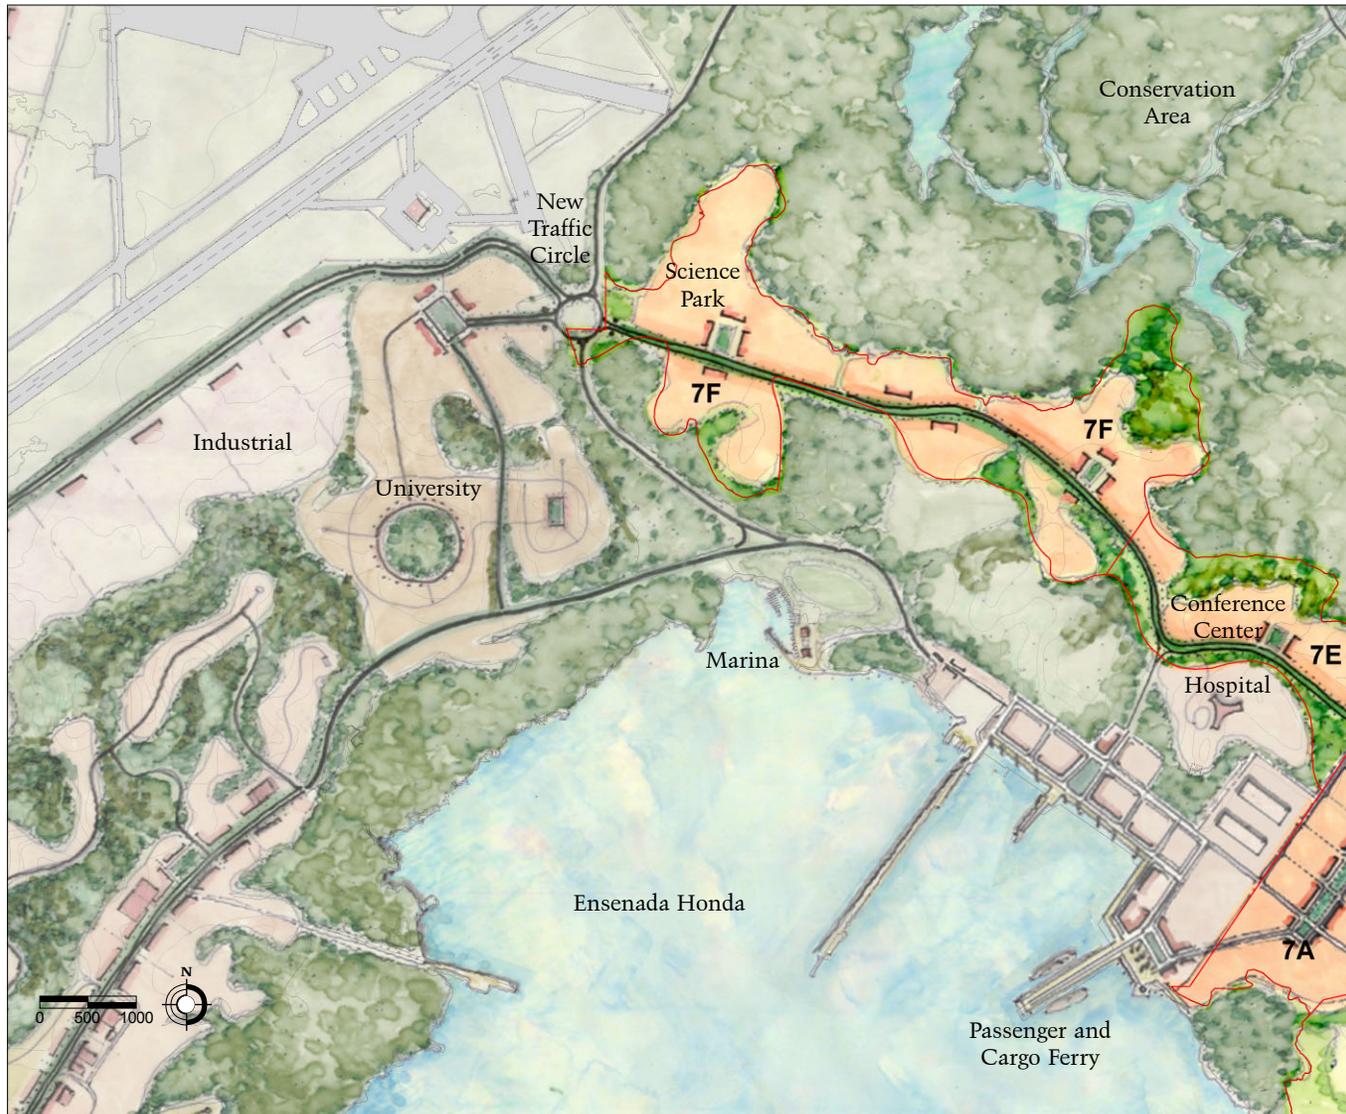

Zone 6B: Marina and Recreational Area: The main road will bend “behind” this zone, clustering athletic fields or other outdoor recreational facilities, with the marina, and waterfront activities, thus creating a sea-to-land recreational area. As the transition from Conservation Area to the Harborfront District, it is important that development here be attractive, of high quality, and well-maintained.

Zone 6C and 6E: Working Mixed-Use Waterfront: A landward commercial street and a seaward promenade frame this area, which may include water-related commercial activities as well as retail, restaurants, and other commercial uses. Mixed uses that generally operate on different schedules (early morning marine activity and evening restaurants and bars, as just one of many possible examples) could produce the following favorable results:

- Create a true mixed-use district with energy and activity day, night and weekend;
- Maximize public access to the limited stretches of waterfront not within Conservation Areas;
- Maximize the potential economic benefit of ferry activity (both tourists and residents);
- Realize the maximum potential of the existing infrastructure; and
- Provide a flexible framework for inevitable change in this area.

Zone 6D: Hospital: The existing hilltop medical facilities will be reused by the wider community. Such a hospital might also tie into the science park and Research University uses at Roosevelt Roads.

Figure VI.9
Zone 7 (N)

Zone 7 (S) General:
A world-class research and development and light manufacturing district, the science park builds on Puerto Rico's pharmaceutical and biotechnology sectors, aspiring to promote collaboration among a range of endeavors and projects. Linked to the airport, industrial and university uses, the science park provides large development parcels with excellent road, air and water transportation options, highly amenitized by the natural setting adjacent to prime conservation land.

(Memphis, TN);
NJ Institute of
Technology
(Newark, NJ);

Zones 7E and 7F: Research Drive, Science Park: A broad, informal boulevard amenitized by an accompanying bicycle path links the Central Waterfront to the University area, stringing together a series of appealing R&D campus sites framed by conservation areas along its way. With a combination of larger and smaller development parcels, a variety of users will be able to find the perfect location. Associated compatible uses that support the science park focus are encouraged.

Roosevelt Roads Reuse Plan

Figure VI.10
Zone 7 (S)

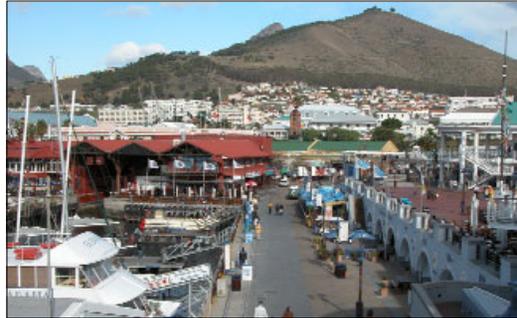

***Zone 7 (S) General:** This rather large and attenuated terrain includes four districts: the Central Waterfront (7A), the Southern Peninsula (7B and 7C), the Northern Peninsula (7D) and the Research Drive district (7E and 7F). Supporting amenities, proximity to the passenger and cargo ferry, and outstanding water views all contribute to the unusual and highly synergistic development potential here.*

Nearby high-quality residential, recreational and commercial resources help make this an attractive and rather unique location in the entire Caribbean region. Conference facilities could serve local and regional users as well as those from the US and international locations.

posal (San Mateo, CA);
Verandah at Beach Club
(Humacao, Puerto Rico)*

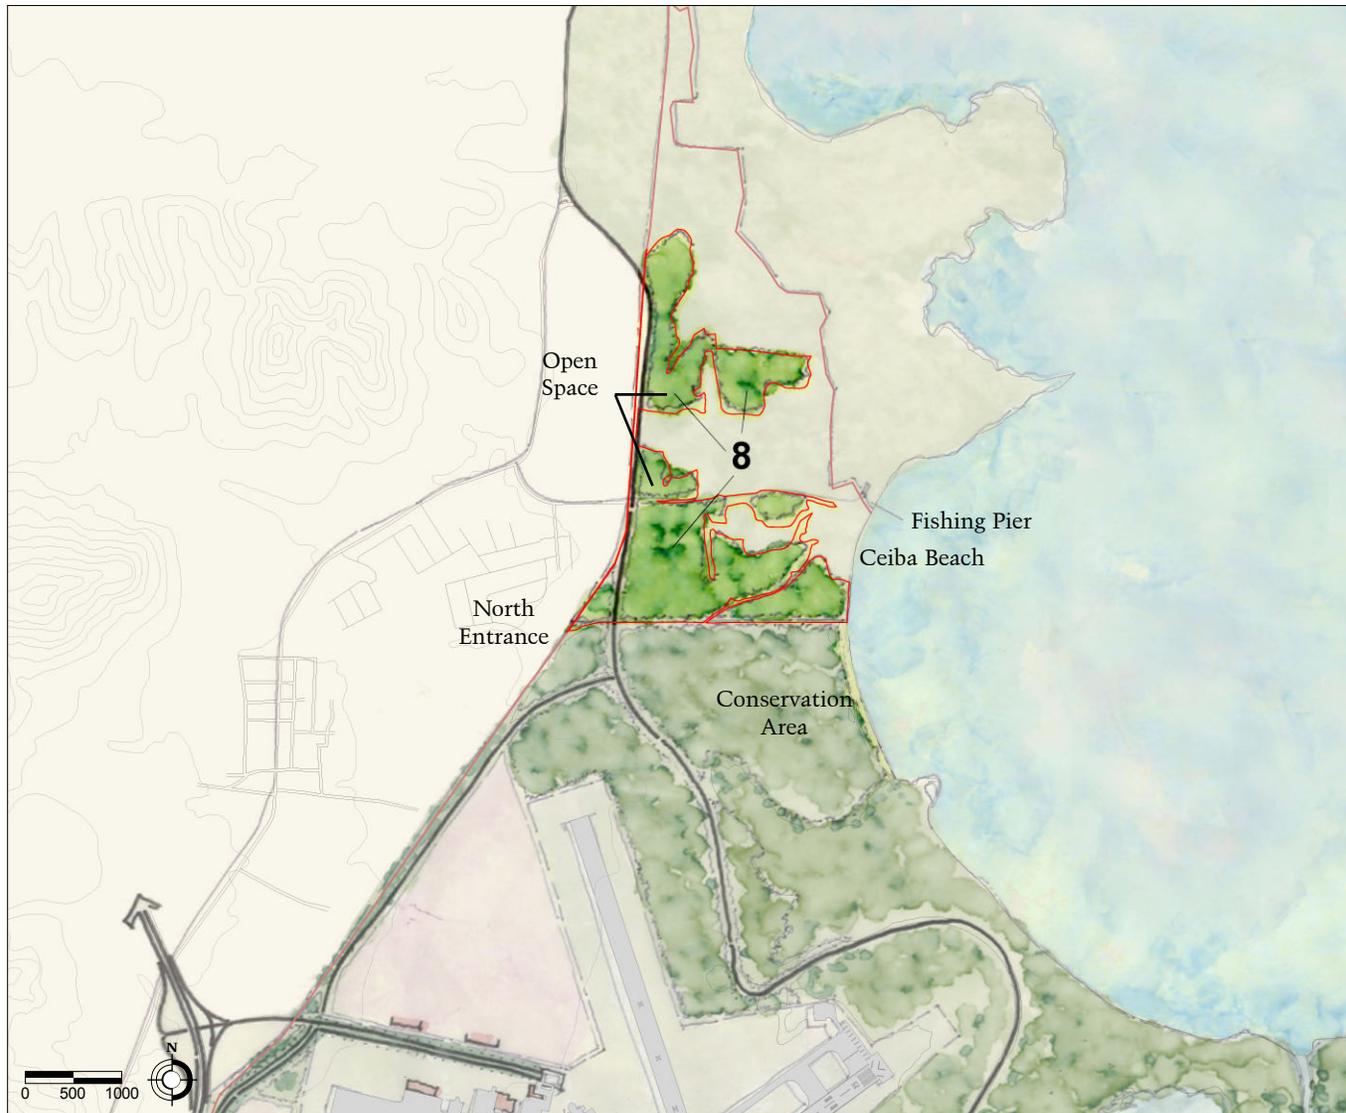

Zone 7A: Central Waterfront and Prado de las Ciencias: Organized in a generous street and block system, Cabo del Norte's Central Waterfront district provides a framework for a wide variety of purposes and will be a key and necessary amenity to assure the viability of the science park. Uses in addition to R&D that contribute to the liveliness of the neighborhood, especially if they help users "park once and walk," are welcome. A generous landscaped spine, the Prado de las Ciencias, provides a second, landward open space focus. These two open spaces will be framed with one to four story buildings close to the sidewalk while parking and service uses will be relegated to the side and rear access lanes.

Zone 7B: Southern Peninsula: Recreational Terrain: The recreational and leisure activities of the Central Waterfront continue on the northern and eastern coasts of Zone 7B. Most of the remaining territory is used for outdoor recreation, such as park, passive open space or golf, with supporting amenities such as a clubhouse and restaurants functioning at the water's edge. Structures should not exceed two stories.

Zone 7C: Southern Peninsula: Conference Facilities: Small-scale conference facilities not exceeding two stories cluster on Cabo del Norte's remote island, its "boot", connected by a low-slung causeway. This beautiful and secluded location supports small meetings and reflective working retreats and celebratory events.

Zone 7D: Northern Peninsula: The Science Park's Conference Facility: Atop the eastern knoll is another small-scale component of the conference center, while the broader developable swaths of land to the west will provide breathtaking views on sites for science park R&D and related uses. Development in Zone 7D should typically be two and a half story structures.

Figure VI.11
Zone 8

Zone 8 General: The Northern gateway area is preserved for public open space, recreation, access to the Ceiba fishing pier facilities and Ceiba Beach. Maintained landscaping along the road provides a suitable entrance to the redevelopment from the north, including a bicycle path. This area provides a critical opportunity to reconnect the town of Ceiba to its beachfront.

Roosevelt Roads Reuse Plan

Figure VI.12
Zone 9

Zone 9 General: Much of the property provides habitat for many species of flora and fauna, including the Yellow Shouldered Blackbird and the West Indian Manatee. Extensive wetlands, mangrove forests and surrounding sea grass beds are protected in several extensive Conservation Areas. A few paths through the conservation areas that provide access and utility routes will be preserved, modestly extended and improved. This complex ecosystem presents an opportunity for well-maintained and controlled nature-based tourist activities (kayaking and canoeing, hiking, wildlife watching, educational trips and the like). To that end, very limited compact and low-scale development to support educational and eco-tourism activities is encouraged, such as visitor interpretive center, eco-lodge overnight accommodation, and administrative and maintenance facilities. Visitors to El Yunque, Vieques and other natural areas of eastern Puerto Rico can make Roosevelt Roads their base.

Street Sections

A significant contribution to the differentiation among the new districts at NSRR will be the creation of landscaped roads, specific to their use and location and always of an appropriately high quality. The range of roads will include relatively formal boulevards Downtown and at the airport, simple curbsless drives in undeveloped areas, and pedestrian-friendly streets with sidewalks, trees and on-street parking. Across the redeveloped site, dedicated paths for pedestrians, joggers and bicyclists will provide a safe alternative to private automobile use and a unifying open space linkage between the key areas of the plan.

VII. Infrastructure: Circulation, Utilities and Public Services

1. Introduction

This chapter summarizes the existing infrastructure and utility systems on Roosevelt Roads, which was presented in detail in the April 2004 working draft report *Site, Context & Market Conditions* (see Appendix A). It goes on to describe the Land Use Plan as it relates to these systems. This was done to determine if the systems, including water, sanitary sewer, storm water, electrical, telecommunications, and roads, will need to be upgraded and expanded, based on proposed “full buildout” improvements included in the Land Use Plan.

Required upgrades to systems are described, along with assumptions and clarifications used. Main components are identified by system; secondary and tertiary upgrades have not and cannot be quantified until a detailed plan is developed. The chapter touches on some of the considerations that must be given to maintaining the systems and possibly transferring them to public service agencies in Puerto Rico. The ultimate buildout of the base will differ from the land use described herein, and as such, system requirements will need to be studied at that time to confirm required upgrades.

This chapter includes order of magnitude, capital development costs for the utility and infrastructure upgrades of the Land Use Plan. These include sanitary sewer system, water supply system, power distribution system and road ways. Site improvement costs (building demolition and construction, landscaping, etc) are not included. Since the end user will determine which buildings will be scheduled for demolition and which for retrofit/reuse, capital costs for these items could not be determined. However, based on the number and square footage of buildings on the site, it is estimated that the costs for building demolition could reach as much as US\$50 million.

The total investment required to develop utility and infrastructure upgrades of the Land Use Plan could reach US\$102 million, based on Yr2004 dollars. This budget number represents full buildout of the base and does not take into account escalation for buildout in future years. Cost estimates for development are provided later in this chapter and are broken into phases. This opinion of cost is exclusive of upgrades to systems for some of the public benefit and economic development conveyances, and upgrades to systems to make them acceptable to and code compliant with utility authorities that may take over the systems from the Navy. As estimated by the Puerto Rico Aquaduct and Sewer Authority (PRASA) and Puerto Rico Electric and Power Authority (PREPA), the costs associated with upgrades to the water/wastewater and electric systems are approximately US\$5.4 million and US\$3.2 million respectively. It should be noted that the future use of the airport (whether public conveyance or not) is to be determined, and could necessitate significant improvements to the existing systems.

Roosevelt Roads Reuse Plan

Costs for infrastructure and utility upgrades are of two types: those that are needed simply for new distribution, i.e., new development areas which previously had no utilities or road access; and costs that are needed to upgrade an existing system based on added demand.

All costs are order of magnitude for budgetary purposes only. The text is specific about what is included in the development of these opinions of probable cost. Assumptions of size, type, materials and unit costs of components were estimated based on past experience. No detailed designs have been performed to generate these costs.

2. Guiding Policies

a. Use Existing Infrastructure To The Extent Possible

In Land Use Plan: Consideration was given to existing systems, before and during development of the Land Use Plan. The infrastructure on the base, with the exception of storm water collection, is fairly extensive and was developed and maintained by the Navy for their installations. Since the Navy installations were spread throughout the base, the basic roadways and utility systems already extend into the vicinity of each zone considered for reuse. Based on interviews with Navy personnel on site, review of Technical Data Packages prepared for the Navy, age of systems, maintenance records, and cursory visual inspection, it appears that the existing system components are in good working order.

The base storm drainage is collected via a system of drop inlets, drainage ditches, culverts and pipes and diverted to outfalls in the mangrove areas and the surrounding bays. The Navy maintains a stormwater discharge permit which is fully transferable. The water system provides both potable and fire water to all developed areas of the base. There are 3 wastewater treatment plants on base, all covered under the National Pollution

Discharge Elimination System (NPDES) permit. These plants provide tertiary treatment, making the recycled water acceptable for irrigation, toilet flushing, and other recycled water uses. Roadways are for the most part two-lane and would need to be expanded to four-lane roads and/or improved with lighting, planted medians, curbs and gutters, in some areas of high-density traffic.

b. Ensure That Operationally Significant Systems Are In Working Order and Properly Permitted:

- i. *The base's water and wastewater systems* are scheduled to be transferred to PRASA. On behalf of PRASA, CMA Architects and Engineers LLP conducted a condition survey of these systems. The survey and related costs are contained in a report titled *Roosevelt Roads Water and Wastewater Systems Evaluation Report* September 2004. Cost estimates were prepared by CMA for the improvements of the water and wastewater systems. As indicated in the report, the cost of necessary improvements to the potable water and wastewater systems is US\$1,358,488, with an additional US\$4,078,120 for improvements to the water filtration plant for anticipated, future water quality regulations for a total improvements cost of US\$5,436,608.
- ii. *Water supply system.* The reservoir, treatment plant, pump stations and distribution lines on the base are in good working order, according to most recent Technical Data Package prepared for the Navy.
- iii. *Wastewater treatment plants.* These are currently covered under one permit. That permit is set to expire in the next year. With the base closed and personnel moved out, there is little wastewater being processed. This will compromise the functioning of the plant(s), and may void the permit. It is important to keep the permit active if the plants are to be incorporated into future uses on the base. The permitting process is arduous and long.
- iv. *Stormwater discharge.* The Navy currently maintains a storm water discharge permit, which is fully

Roosevelt Roads Reuse Plan

transferable. Future development may require a stormwater management system.

- v. *Electrical substations:* There are two main high voltage (38 kV) feeds into the base; one to the airfield and one at Daguao, which serve 11 substations throughout the base that step down and distribute power to each zone.

c. Phase Infrastructure Improvements Based On New Development: The Land Use Plan involves phased construction, based on demand. Improvements to infrastructure should be phased to correlate with development. This is described in detail later in this section.

d. Consider Key Issues

- i. *Wastewater treatment plants:* It is important to keep the plants operational and the NPDES permit valid.
- ii. *Conveyances:* The Homeland Security area, Army Reserve area, and the US customs area will be transferred by the Navy. The airport, port/ferry terminal, etc. may be conveyed by the Navy to various other agencies. Populations, building square footages, demand for utilities etc. for these conveyances are not known at this time and are therefore not included in this section. The demands on the utilities due to the hospital and schools, which could be conveyed by the Navy, have been estimated. The future use of airport and associated fuel tanks and Pier 1 must be determined and analyzed.
- iii. *Water tapping and water quality:* It is said that the raw water conduit that conveys water from Rio Blanco to Roosevelt Roads is tapped outside the base by residents. This water is not safe to drink, and notices have been sent around to residents by the Navy Public Works Department. It is unknown what quantity of raw water is collected in this way, and whether this practice will grow in the future.
- iv. *The installations on Roosevelt Roads* were constructed by the Navy, and some of the systems may be con-

structed to different standards than are acceptable to certain municipal, Commonwealth, or Federal agencies. Code compliance was not included in this scope of work. The systems on the base are not metered. All new development will need to include meters as part of the infrastructure improvement program.

3. Land Use Plan, as it Relates to the Utilities and Infrastructure

The Land Use Plan is described and graphically shown in Chapter V. There are several parcels of land that will likely be conveyed to various entities. The proposed conveyances are referenced within this chapter for the utilities and infrastructure, such as they relate to the overall demand on and capacity of the systems. With the exception of the Army Reserve area, the Homeland Security area and other possible conveyances (the airport and port/ferry terminal), the loads from these conveyances have been estimated and considered in determining upgrades.

The Base has been divided into zones, based on existing land uses, development and geography. The zones and potential development that are described herein were used to determine adequacy of existing infrastructure and utility systems to accommodate improvements.

- **Zone 1** includes the existing airfield. The Puerto Rico Ports Authority (PRPA) has commissioned a Master Plan study for the airport, separate from this report. The final master plan is not available as of the writing of this report. A preliminary report summary has been issued thus far. The remainder of Zone 1 is planned for light industrial and retail development. At full build-out, there is a potential for 6.9 million square feet of light industrial space, employing 6,900 people, and 500,000 square feet of retail space. The buildings in Zone 1B (see Figures V.2 and V.4) may be demolished to make way for the new development. The ultimate

Roosevelt Roads Reuse Plan

use of the airport may drive the need for infrastructure improvements.

- **Zone 2** preferred development involves new moderately priced lodging on the order of 400 rooms; 310 new residential dwelling units; and a 120,000 SF government/training center. It would need to be determined by future developers whether buildings in Zones 2B and 2C (see Figure V.6) could be retrofitted or demolished to accommodate new uses.
- **Zone 3** includes upgrading the existing 9-hole golf course, which is prone to flooding, to an 18 hole, semi-dry course. It is assumed that irrigation for watering the course could be available from treated wastewater.
- **Zone 4** involves 150,000 square feet of commercial space; 650,000 square feet to be used for back-office, call center; 364 new residential dwelling units; and a 900,000 square feet university campus. The public school in 4G will be used as a middle/high school (see Figures V.10 and V.12).
- **Zone 5** involves 1,200 new dwelling units on 350 acres. The future developer of this zone would determine which, if any, buildings are retrofitted or demolished to make way for new construction. It is assumed that the public school in 5D (see Figure V.14) would be retained as a private bilingual school.
- **Zone 6** The Land Use Plan for Zone 6 includes expanding the existing, 72-slip marina to 250-slips; developing 10,000 square feet of marine commercial activity; 50,000 square feet of water-oriented commercial space; and 300,000 square feet of commercial and warehouse space; along with the ferry terminal proposed by PRPA for transporting people and cargo to/from Vieques and Culebra. Marina expansion could involve the depletion of 10-20 acres of sea-grass beds, which may need to be mitigated with Puerto Rico environmental regulatory agencies. The cost for this mitigation is not included in the capital cost numbers given

at the end of this section. The Land Use Plan includes development in Zones 6B, C and E. Future developers would determine which if any existing buildings should be salvaged or demolished (See Figure V.16).

- **Zone 7** involves creating a research and development science park center, on the order of 1.1 million square feet; a conference center with 250 rooms; and 1,250,000 square feet of research and development as a gateway to Science Park. All buildings in Zone 7 would likely need to be demolished in this scenario (see Figures V.18 and V.20). The existing landfill is retained in this scheme, and capped. It is assumed that the cost of capping the landfill will be incurred by the Navy. Therefore, the cost for this item (estimated at \$20 million) is not included in this analysis.
- **Zone 8** The Land Use Plan for Zone 8 does not involve providing utilities or infrastructure (see Figure V.22). No capital costs have been developed for Zone 8.
- **Zone 9** This area is designated in the Reuse Plan as a conservation area. While there may be some utilities and infrastructure required to serve educational and ecotourism-related activities in this zone, no plans have been formulated. As a result, capital costs have not been estimated.

4. Water System

a. Water Supply and Distribution System: The water supply system for Roosevelt Roads is described in detail in the *Site, Context & Market Conditions* working draft report. The raw, untreated water is conveyed to Roosevelt Roads via a 27-inch diameter reinforced concrete water main from the Rio Blanco River to the 43 million gallon capacity reservoir inside the Base. From there, the water enters the filtration plant. The filtration plant renders the water potable. The plant's 4 million gallons per day capacity is used for both potable water and fire protection.

Roosevelt Roads Reuse Plan

The treated water is distributed throughout the site by predominantly polyvinyl chloride (PVC) pipe, boosted by pump stations. PVC pipe may not be acceptable to future users, including a master developer and Puerto Rico's public utility agencies. However, it is assumed in this analysis that PVC pipe will be acceptable. The upgrades to the system described herein assume new PVC pipe, approved by the American Waterworks Association (AWWA).

The existing water distribution system was modeled using Haestad's WaterCAD v6.5 software. The existing system is so large that to model every single element of the system would not be practical for this investigation. At this preliminary planning stage, including each individual service connection, valve, and numerous other elements that make up the actual network is unwarranted and unnecessary. It would be beneficial to perform this type of analysis when ultimate users are known.

The model developed for this limited study is a simplified version of the existing network. The portions of the network that are not modeled are not ignored; rather, they are included as attributes. In this way, the integrity of the system remains intact while the number of elements in the model is reduced and simplified.

b. Sensitivity of the System Based on Re-development or New Development: The Roosevelt Roads Reuse Plan is broken down into zones based on previous land use. Once specific development activity is planned, the water line connections should be carefully designed and coordinated to maximize use of the existing water distribution system. New development on the Base is sensitive to geographical locations within the Base and also relative location with respect to utility infrastructure. This section describes the sensitivity of the water system to accommodate peak demands and fire flows.

There are a few options available to upgrade the existing system depending on the locations of the new facilities within each zone. One of the options is to recon-

struct portions of the existing system within the new areas of development. This option would be less expensive than others, but will require that the additional peak and fire flow demands associated with the proposed facilities be limited and thus not significantly increase the capacity of the zone. The new facilities would have to be located fairly close to the existing main water line and at relatively the same elevations as the existing buildings and or roadways for this option to be realized. Another upgrade option is to install booster pump stations along the existing line. This option is more expensive than the first but would allow the new facilities to be located farther away from the existing water mains, be located at higher elevations if necessary, and could place slightly larger demands on the existing system without failing. A third upgrade option is to install either an elevated or ground level tank. This option would be more expensive than the others but it would not restrict the location of the new facilities within the zones. This option would allow the new facilities to be located on even higher elevations with the ability to place much higher demands on the existing system without failing.

Although the most expensive option, there are several advantages to installing tanks. Proper tank location helps to stabilize pressure in the lines, and tanks will allow the peak and fire flow demands to be increased dramatically throughout the zone.

The proposed development plan requires a minimum treated water capacity of 1,275 gallons per minute (GPM) or approximately 1.85 million gallons per day (MGD) which is well under the existing system maximum capacity of 4.0 MGD. The limiting factor for the existing system is the size of the water mains, the available line pressure, and the elevation of the existing and proposed facilities. Since the demands on the system from the Homeland Security area, the Army Reserve area, Federal transfer areas, the airport and the port/ferry terminal were not considered, it is possible

Roosevelt Roads Reuse Plan

that the combined demand from proposed new development could exceed current capacity.

Potable demands for each zone were determined from the following reference, Hydraulic Design Handbook (1999) by Larry W. Mays. The demands were based on land use, acreage, and residents and/or occupants using the facilities in gallons per day. The demands in gallons per day were then converted to gallons per minute for use in the WaterCAD model.

Fire flow demands for each zone were determined from the following reference, Water Distribution Modeling (First Edition 2001) by Haestad and were shown in gallons per minute, requiring no conversion for the WaterCAD model.

c. Land Use Plan: Water Requirements: The model was prepared based on the proposed development outlined in this report. If any changes are made to the proposed developments and uses, the system should be re-analyzed at that time, to determine adequacy to meet demand.

- **Zone 1** is located in the northwestern portion of the project site and contains approximately 773 acres that are currently developed and roughly another 861 acres which are developable. The airport is located within this developed portion of the zone and is not operating at the present time. The developable portion of this zone is slated for industrial and retail space.
 - i. *New Main:* With new industrial development north and south of the existing runway, it is expected that 4,700 linear feet of new water main would be required for distribution.
 - ii. *Upgrades to System:* The potable demand required for Zone 1 was approximated to be 200 gallons per minute (GPM). The fire flow demands for Zone 1 were added to the potable demands at the same locations. The total fire flow demand required for Zone 1 was

approximated to be 2,500 GPM, in addition to the potable demand of 200 GPM.

Based on the model runs for this zone both the peak demands and the fire flow demands were achieved without encountering negative residual pressures. The current system will handle the potential future 6.9 million square feet industrial space and 500,000 square feet retail space without upgrades.

- **Zone 2** is located in the southwestern corner of the project site and contains approximately 87 acres that are currently developed and roughly 80 acres which are developable.
 - i. *New Main:* No new water main is anticipated.
 - ii. *Upgrades to System:* The potable demand required for Zone 2 was approximated to be 160 GPM. The fire flow demands for Zone 2 were added to the peak demands at the same locations. The total fire flow demand required for Zone 2 was approximated to be 750 GPM, in addition to the potable demand of 160 GPM.

Based on the model runs for this zone both the peak demands and the fire flow demands were achieved without encountering negative residual pressures. The current system will handle the potential future residential development without upgrades.

- **Zone 3** is located just to the north of Zone 2 and contains approximately 78 acres that are currently developed and roughly 88 acres which are developable. The available portion of this zone is slated for golf course expansion.
 - i. *New Main:* No new water main is anticipated for the golf course expansion. If necessary, recycled wastewater could be piped to golf course for irrigation.
 - ii. *Upgrades to System:* The potable demand required for Zone 3 was approximated to be 25 GPM. This demand was applied at one location within the zone. The fire

Roosevelt Roads Reuse Plan

flow demand for Zone 3 was added to the potable demands at the same location. The total fire flow demand required for Zone 3 was approximated to be 500 GPM, in addition to the potable demand of 25 GPM.

Based on the model runs for this zone both the peak demands and the fire flow demands were achieved without encountering negative residual pressures. The current system will handle the potential future expansion of the golf course without upgrades.

- **Zone 4** is located southeast of the existing airport and contains approximately 219 acres that are currently developed and roughly 258 acres which are developable. Residential and university space is recommended for the available land in Zone 4.

- New Main:* No new water main is anticipated.
- Upgrades to System:* The potable demand required for Zone 4 was approximated to be 200 GPM. This demand was applied at four locations within the zone. The fire flow demand for Zone 4 was added to the potable demands at the same four locations. The total fire flow demand required for Zone 4 was approximated to be 2,000 GPM, in addition to the potable demand of 200 GPM.

Based on the model runs for this zone both the peak demands and the fire flow demands were achieved without encountering negative pressures. The current system will handle the future residential area and university additions without upgrades.

- **Zone 5** is located on the southeastern tip of the project site and contains approximately 308 acres that are currently developed and roughly 180 acres which are developable. The preferred land uses for the zone are residential and school.
- New Main:* The Land Use Plan involves development in Sub-Zone 5A, where previously there was none. A

total of 4,195 linear feet of new water main may be necessary for the proposed improvements.

- Upgrades to System:* The potable demand required for Zone 5 was approximated to be 140 GPM. This demand was applied at two locations within the zone. The fire flow demand for Zone 5 was added to the potable demands at the same locations. The total fire flow demand required for Zone 5 was approximated to be 1,000 GPM, in addition to the potable demand of 140 GPM.

Based on the model runs for this zone both the peak demands and fire flow demands were achieved without encountering negative pressures. The current system will handle the potential future residential areas and the new school without upgrades.

- **Zone 6** is located northeast of Zone 4 and contains approximately 237 acres that are currently developed and roughly 45 acres which are developable. The proposed land uses are a 250-slip marina; 10,000 square feet of marine commercial activity; 50,000 square feet of water-oriented commercial space; and 300,000 square feet of commercial and warehouse space; along with the ferry terminal proposed by PRPA for transporting people and cargo to/from Vieques and Culebra.

- New Main:* No new water main is anticipated.
- Upgrades to System:* The potable demand required for Zone 6 was approximated to be 100 GPM. The fire flow demand for Zone 6 was added to the potable demand at the same locations. The total fire flow demand required for Zone 6 was approximated to be 1,500 GPM, in addition to the potable demand of 100 GPM.

Based on the model runs for this zone the peak demands were achieved without encountering negative pressures. However, when the fire flow demands were added to the potable demands the system began to breakdown and negative residual pressures were

Roosevelt Roads Reuse Plan

encountered. The current system will not handle the potential future commercial development demands without upgrades. A suggestion for upgrades of the existing system would be to incorporate a booster pump station to help meet the fire flow demands. This pump station would have to be located near the main water line and would feed the new facilities that are planned.

- **Zone 7** is located on the eastern most portion of the project site and contains approximately 213 acres that are currently developed and roughly 407 acres which are developable. The preferred land use for this zone is science park/conference center.

i. *New Main:* No new water main is anticipated.

ii. *Upgrades to System:* The potable demand required for Zone 7 was approximated to be 450 GPM. The fire flow demand for Zone 7 was added to the potable demand at the same locations. The total fire flow demand required for Zone 7 was approximated to be 2,200 GPM, in addition to the potable demand of 450 GPM.

Based on the model runs for this zone the peak demands were achieved without encountering negative pressures. However, when the fire flow demands were added to the potable demands the system began to breakdown and negative residual pressures were encountered. The current system will not handle the potential future science park development demands without upgrades. A suggestion for upgrades of the existing system would be to incorporate either a booster pump station or a tank to help meet the required fire flow demands. This pump station would have to be located near the main water line and would feed the new facilities that are planned.

d. Assumptions and Clarifications

- New hydrants would be located along all new mains. New main would be tied into existing via wet tapping method. New meters would be required for each of the new buildings. Figure VII.1 illustrates the areas in which new water mains may be required.

- For the purposes of this study, a design flow of 2 million gallons per day from filtration plant was assumed.
- Only water mains were estimated, not laterals.
- Water meters and hydrants are included in capital cost.
- The demands of the hospital and schools were approximated for this study. Demand resulting from Federal transfers, prospective public benefit conveyances and economic development conveyances are unknown at this time and therefore were not considered.

5. Sanitary Sewer System

a. **Sanitary Collection and Treatment System:** The wastewater collection system at Roosevelt Roads consists of approximately 32.5 miles of gravity lines, 9.5 miles of force mains, approximately 906 manholes, 28 pump stations, 6 grinder stations and three treatment plants. The original collection system was installed in the 1940's with upgrades and new installations made in the 1990's. The system is described in detail in Site, Context & Market Conditions. Treated wastewater is discharged into the ocean. The average daily treated flow from the three plants was approximately 0.81 million gallons per day, when the base was active. Since it receives tertiary treatment, treated wastewater could be used for irrigation, flushing toilets, and other recycled water uses.

b. Land Use Plan:

Sanitary: New sewer lines and ancillary components.

- **Zone 1** Approximately 13,300 linear feet of new sanitary line would be required to service proposed industrial park.
- **Zone 2** The new development at the northwest corner of Zone 2 could require 1,000 linear feet of new sanitary line.
- **Zone 3** No new main sanitary lines are anticipated as a result of the golf course expansion.

Roosevelt Roads Reuse Plan

- **Zone 4** No new main sanitary lines are anticipated as a result of the Land Use Plan.
- **Zone 5** The Land Use Plan involves development in Zone 5A, where previously there was none. A total of 4,100 linear feet of new sanitary main may be necessary for proposed improvements.
- **Zone 6** No new main sanitary lines are anticipated as a result of Land Use Plan.
- **Zone 7** Approximately 4,500 linear feet of new sanitary main could be required for service to Zone 7D.
- **Zone 8** No new upgrades to sanitary are anticipated.

Upgrades due to demand: With maximum buildout of 2.4 million square feet of science park, the Land Use Plan will tax the capacity of the Forrestal treatment plant in Zone 7. For the purposes of this study, it was assumed that one of the following would be required: either a pre-packaged treatment plant on the order of 500,000 gallons per day at Forrestal; or a bypass system to convey the wastewater to the Bundy treatment plant in Zone 2, via the Capehart bypass. The Bundy plant has excess capacity under full buildout condition. The cost of the systems is comparable. The capacity of the Capehart treatment plant is adequate to service the needs for proposed improvements in Zones 5. This does not consider any improvements to the Zone 1 airfield, which is the subject of an Airport Master Plan by PRPA. Figure VII.2 illustrates proposed upgrades to sanitary system.

c. Assumptions and Clarifications:

- The demands on the sanitary sewer due to the Navy conveyances, with the exception of the hospital and the schools, are not considered in this study.
 - Only main lines were estimated for capital costs. House connections were not estimated, and are assumed to be within the budget number for building construction.
- Permitted capacities of existing treatment plants were used to determine required upgrades.

6. Storm Drainage System

a. Drainage System: Stormwater runoff is collected via a system of drop inlets, drainage ditches, culverts and pipes and diverted to outfalls in the mangrove areas and the surrounding bays. Any new development on the Base will have to analyze drainage patterns to determine if new drainage systems are required.

b. Land Use Plan; Drainage Considerations: The Land Use Plan did not delve into the development of areas with varying grades. The topography and surface grading treatment of the ultimate development will dictate new drainage requirements. Drainage components are not included in the capital cost estimates.

7. Electricity and Telecommunications Systems

a. Electrical Supply and Distribution System: The Puerto Rico Electric and Power Authority (PREPA) may take over the Base electrical system. PREPA is currently considering the takeover of Alpha, Bundy, Charlie, Coral Sea, Delta, FDR and India substations, and the incoming and outgoing circuits at each substation. PREPA has indicated that improvements necessary to meet the standards of both PREPA and the security industry would require an estimated US\$3.2 million investment, with an estimated \$450,000 per substation. The improvements included in the estimate are the acquisition of new land around the substations to provide adequate access for service vehicles; installation of driveways and new fences; upgrades to electrical equipment and integration of the NSRR substations into PREPA's energy administration system. PREPA noted that these estimates do not include any necessary improvements to the transmission system.

Roosevelt Roads Reuse Plan

There are two main high voltage (38 kV) feeds into the Base; one to the airfield and one at Daguao, which serve 11 substations throughout the Base that step down and distribute power in their vicinity at 13.2 kV, 4.16 kV and 480 V. There are no reported deficiencies with the power distribution system.

b. Land Use Plan; Power and Telecommunications: New power/telecommunication lines and ancillary components:

- **Zone 1** The 6.9 million square feet of industrial space and 500,000 square feet of retail space at full buildout would require an additional substation for power, and associated distribution lines for power and telecommunication.
- **Zone 2** The Land Use Plan would require an additional substation in Zone 2. Approximately 1,000 linear feet of each power and telecommunications would be required for distribution.
- **Zone 3** Approximately 2,000 linear feet of power and telecommunication distribution lines are anticipated as a result of the golf course expansion.
- **Zone 4** The Land Use Plan would require 2 new substations. Approximately 1,000 linear feet of each power and telecommunications would be required for distribution.
- **Zone 5** The differential of the 1200 new residential dwelling units in the Land Use Plan over the existing 800 +/- will require a new substation, and approximately 4,500 linear feet of new power and telecommunications lines.
- **Zone 6** The Land Use Plan would require 2 new substations. Approximately 2,000 linear feet of each power and telecommunications would be required for distribution.
- **Zone 7** the 2.4 million square feet of research and development facilities and 250 room conference center included in the Land Use Plan will require 2 new substations, and approximately 3,000 linear feet each of power and telecommunications lines.
- **Zone 8** No new upgrades to power or communication systems are anticipated.

Figure VII.3 illustrates the potential substation locations that would be required based on Land Use Plan.

c Assumptions and Clarifications

- The power demand from Federal transfers and other conveyances, with the exception of the hospital and the schools, are not considered in this study.
- Only main distribution lines were estimated for capital costs. Individual connections to buildings are not included, and are assumed to be within the budget number for building construction.

8. Road Systems

a. Roadway Network: NSRR is easily accessible via both PR-3 (a two lane highway) and PR-53 (a four lane highway). The majority of the primary roads on the Base are two lanes wide and paved asphalt. The roads extend throughout the Base to virtually all areas on the Base. In most areas there are no curbs and gutters, and minimal if any lighting. These roads are in fair to good condition, but would need to be upgraded for heavy traffic.

b. Land Use Plan; Road Upgrades: A roadway circulation plan was developed for the Land Use Plan. In this circulation plan, a number of roadway types are specified for the Base, that would link the different zones on the Base. Most of these primary roads include 4 driving lanes, with various types of landscaping and plantings, positive drainage, and lighting. The circulation plan results in approximately 45 miles of primary road throughout Zones 1 through 7. In the absence of a detailed condition report of all the roads in the Base, it was assumed that the existing roads would be re-grad-

ed or re-constructed. The capital costs included at the end of this chapter are therefore ‘worst case scenarios’ with regard to road demolition and construction. It would be up to the future developers to determine the extent of new construction and the level of landscaping elements (grasses, trees, lighting). The cost estimates do not include landscaping or lighting since there is large variability in type and quality of such architectural elements.

c. Assumptions and Clarifications

- This study did not include siting developments beyond a zone level. Detailed design would be required to analyze potential congestion areas and to determine levels of service for various roadways.
- Only primary roads were considered in the study. Upgrades and new secondary roads may be necessary for actual developments.

9. Phased Construction

Based on the phasing program developed as part of this study, the development of the site is assumed to take place over the course of approximately 34 years. The upgrades to and construction of new infrastructure elements should be phased to correlate to new areas of development. In this way, only those improvements necessary to support the utility demands at any given point in time are performed. This will spread the cost for infrastructure improvements over the approximately 34 year period.

Figures VII.1 through VII.3 show the assumed areas for utility upgrades and new utility installation based on the Illustrative Phasing Program developed for Roosevelt Roads. The cost estimates were developed to reflect these phased improvements (see Tables VII.1 through VII.22).

10. Capital Costs

The total cost for upgrades to the utility and infrastructure systems in the Land Use Plan is estimated at US\$102 million. (This figure does not include the US\$8.6 million in new upgrades to systems to make them acceptable to and code compliant with utility authorities.) Table VII.1 shows how improvements could be phased to match the development program. It should be noted that of this US\$102 million, approximately US\$21 million is estimated for construction of new collector roads. If the existing roads were improved instead of newly reconstructed, the total cost could be around US\$80 million.

It should be noted that:

- *Costs associated with replacing existing PVC water and sewer lines, should that be required by a developer, is not included herein. It is assumed that PVC pipe is acceptable and all new piping is assumed to be PVC.*
- *Costs for lighting and landscaping the road sections are not included in this order of magnitude estimate, since neither landscape nor lighting design has been performed. There is a large variation in costs by planting type and light fixture type.*
- *Costs for upgrading the existing water and sewer to be PRASA compliant are being developed by PRASA. The costs were not available at the time of this writing.*
- *Costs for upgrading the existing electrical system to be PREPA compliant were not available at the time of this writing.*
- *Costs for relocating utilities as a result of road construction were not included. It is assumed the existing utility runs will be satisfactory.*
- *Costs for mitigation for taking sea-grass beds are not included.*
- *Analysis of infrastructure does not include future*

Roosevelt Roads Reuse Plan

demand from Federal transfers such as the Homeland Security areas, the Army Reserve area, and other conveyances, including but not limited to the airport and the Vieques/ Culebra ferry terminal and related port uses. As such, costs for any necessary upgrades associated with Federal transfers and other Navy conveyances cannot be estimated at this time and have not been included.

All costs are order of magnitude for budgetary purposes only. Assumptions of size, type, materials and unit costs of components were estimated based on past experience. No detailed designs have been performed to generate these costs.

VIII. Notice of Interest Responses for Public Benefit Conveyances

On May 3, 2004, the U.S. Navy published its notice of surplus property regarding NSRR in *The San Juan Star* and in *El Nuevo Día*. Pursuant to, and in excess of, the requirements of 24 C.F.R. § 586.20(c), on May 4, 2004 the LRA published a Notice of Availability of Surplus Property to Commonwealth and Local Interests in two newspapers of general circulation in the vicinity of the installation, i.e., *The San Juan Star* and *El Vocero*. In the newspaper notice, the LRA announced that it would receive notices of interest (“NOI”) until August 3, 2004, a time period that exceeds the 90 day period required by the regulations.

The LRA used this same process to solicit NOIs from both homeless services providers and from public and non-profit entities interested in public benefit conveyances (“PBCs”). Nevertheless, the purpose of the PBC and homeless services NOIs is fundamentally different in the Reuse Plan process, since none of these PBCs have the same kind of priority that the law gives to homeless services providers. The NOIs for PBCs were viewed by the LRA as an additional mechanism for community participation, which would help educate the LRA as to potential uses of the property. While most of the NOIs were formally received on August 3, 2004, the LRA had been in communication for various months before that with most of the interested parties, and their interests have helped shape the decisions made in this Reuse Plan.

There are several mechanisms for the Navy to dispose of the real property on NSRR. PBCs are one such mechanism. Other methods are negotiated sales, Economic Development Conveyances (“EDCs”), which are specifically recognized in the BRAC law, and public sales. The LRA and the Navy will agree on a disposition strategy after the Reuse Plan is finalized.

The acceptance of a formal PBC application by the Navy, which would not take place until after the Reuse Plan is finalized, is within the discretion of the Navy. The PBC mechanism can be useful in accomplishing certain objectives in the Reuse Plan, but it must be used carefully because of the various restrictions imposed on properties transferred through PBCs, primarily that the property be used for the specific purpose of the PBC for a period of at least 30 years, otherwise, the property would revert to the Navy.

The NOIs received by the LRA are all described on the following pages.

A. Low Income Self Help Housing Assistance

The legal authority for this kind of transfer is codified at 40 U.S.C. § 550(f).

1. Ceiba Housing and Economic Development Corporation. Elderly Housing for Independent Living Project in the Algodones housing complex (Buildings 1916, 897, 895 and 893). This interested party is an eligible nonprofit organization, but the proposed project does not qualify for a low income housing PBC because it is not a self-help project as required by the statute. The LRA, however, views a project of this kind favorably and the Reuse Plan establishes various areas within the base where this kind of project could be developed. The LRA will continue to work with this proponent to attempt to make a project of this kind a reality.
2. Ceiba Housing and Economic Development Corporation. Low Income Housing for Young Couples in the Rainbow or Nimitz housing area. This project does not qualify for a low income housing PBC because it is not a self help project, as required by the statute. Nevertheless, the LRA also views a project of this kind favorably and the Reuse Plan establishes various areas within the base where this kind of project could be developed. The LRA will continue to work with this proponent to attempt to make a project of this kind a reality.
3. Hogar de Envejecientes Betesda, Inc. Housing assistance for elderly people who do not earn social security. This interested party is an eligible nonprofit organization, but this project does not qualify for a low income housing PBC because it is not a self help project, as required by the statute. No specific buildings were identified for this project. The building requirements described in the NOI do not fit any existing structure or set of structures and would require significant construction of new facilities.

B. Public Health

The legal authority for this kind of transfer is codified at 40 U.S.C. § 550(d).

1. Servicios de Salud Episcopales, Inc. Hospital. This interested party is an eligible 501(3) not for profit organization, which proposes to provide the following services in the existing hospital (Building 1790 and adjoining facilities): emergency room; secondary level inpatient services for general medicine, surgery, Ob-Gyn, nursery and pediatrics; transportation and referral system; rehabilitation services; and ancillary and administrative support. This NOI is responsive to some of the most important needs described by the community, particularly the emergency room. The LRA endorses the transfer of the hospital facilities as a PBC.
2. Department of Health, Commonwealth of Puerto Rico. Use of the hospital (Building 1790 and adjoining facilities) for a rehabilitation facility for individuals with neurological impairments. While there is a great need for a facility of this kind in Puerto Rico, this proposal is less responsive to the needs of the communities of Ceiba and Naguabo than the proposal by Servicios de Salud Episcopales, Inc. Accordingly, the LRA would prefer to see a facility that would provide emergency room services.
3. Department of Veterans Affairs ("DVA"). Community-Based Outpatient Clinic ("CBOC") and State Veterans Nursing Home. The NOI identifies three options for the CBOC project: (i) the conveyance of ten acres of land for the DVA to build its own facility; (ii) use of the existing clinic (Building 2082) and adjoining areas for expansion and parking; and (iii) use of the existing dental clinic (Building 2338) and adjoining areas for parking. As a Federal agency, the DVA is not eligible for a PBC, but the LRA recognizes the need to provide more accessible health care facilities to the 13,000 veterans residing in the eastern area of Puerto Rico. The

LRA believes that the existing clinic and the adjoining land provide the best option for the DVA to establish the CBOC. The LRA is evaluating alternatives that will allow the DVA to use this facility for the CBOC. The Nursing Home project is a longer term option that should be addressed at a later stage.

C. Education

1. Department of Education. This proponent presented various proposals within one NOI: (i) a language school in the existing elementary school (Building 2085); (ii) a high school specializing in arts, physical education, and academically talented students (Buildings 2200 and 2295); (iii) a mechanical aviation vocational school (unidentified hangar and runway in the airport); and (iv) an academic development center (30,000 square feet of offices and classrooms for training and 200 parking spaces (no specific structure identified)). The LRA recognizes the need in the community for a new high school. The LRA believes that through zoning, the facilities of the former Elementary School (Building 2085) can be preserved for use as a public high school that could fit the concept presented by the Department of Education. Any purchaser of this property will know in advance that the property has to be used for a public school. Accordingly, the property will be ultimately conveyed to the Department of Education without the restrictions inherent in an educational PBC. In order to maintain a better mix of educational facilities in the base, the LRA is recommending that the bilingual school be privately operated, as indicated above. The LRA is recommending that the airport facilities be transferred to the Puerto Rico Ports Authority. The LRA encourages the Ports Authority and the Department of Education to reach an agreement that could allow the Department of Education to operate its mechanical aviation vocational school within the airport facilities.
2. Quality Schools International. Bilingual School. The LRA strongly endorses the need for a private bilingual school within the base facilities, as essential to the redevelopment plans outlined in the Reuse Plan. The LRA believes that through zoning, the facilities of the former middle/high school (Buildings 2200 and 2295) can be preserved for use as a bilingual school. The LRA is currently evaluating options to guarantee that the existing school buildings can be used for a school, without the restrictions inherent in an educational PBC. In this case, in particular, the interested party is not eligible for a PBC because it is not a recognized 501(c)(3) organization.
3. University of Puerto Rico-Humacao. Research activities of the Departments of Chemistry and Biology, including a marine education center (Buildings 885, 886 and 888). The indicated buildings are located in an area of the base that the LRA has determined is better suited for residential use. Nevertheless, the interest expressed by this proponent has helped bolster the concept of a science park, which the Reuse Plan proposes for Zone 7. The LRA will be requesting an EDC of an area within Zone 7, where the activities described by this proponent could be undertaken.
4. Polytechnic University, Pre-engineering Program. The NOI details various needs in terms of both buildings and other facilities, which the proponent states could be accommodated by using the high school buildings (Buildings 2200 and 2295) and the former dry dock facility. The LRA has decided to use the existing high school as a bilingual school, but the interest expressed by this proponent has helped bolster the concept of the university campus and the science park. The LRA is confident that the activities described by this proponent could be conducted in the facilities of the EDC to be requested by the LRA.
5. Polytechnic University, Center for Ocean Research and Engineering. The NOI details various needs in

Roosevelt Roads Reuse Plan

terms of both buildings and other facilities, which the proponent states could be accommodated by using the high school buildings (Buildings 2200 and 2295) and the dry dock facility. These facilities seem to be essentially the same as in the NOI for the pre-engineering program. The interest expressed by this proponent has also helped to bolster the concept of the science park. The LRA is confident that the activities described by this proponent could be conducted in the facilities of the EDC to be requested by the LRA.

6. Ann Wigmore Natural Health Institute. Educational center for lifestyle improvements for greater health. This interested party, an eligible 501(c)(3) organization, has indicated a desire to use Buildings 725 through 729 and Building 1688 for this educational center concept. The community has requested that these buildings be designated for reuse as moderately priced lodging facilities. This NOI has been withdrawn.
7. Santa Maria Boat School of Puerto Rico, Inc. Deep water pier for the 135' R/V Santa Maria, a small warehouse, and a building with 25 rooms for classes, laboratories and administrative offices and a museum, and 4-5 houses or dormitories. This interested party is a nonprofit corporation, but it is unclear from the NOI whether it is recognized as a 501(c)(3). The proposed activity is consistent with the science park concept proposed in the Reuse Plan for Zone 7. The LRA is confident that the activities described by this interested party could be conducted in the facilities of the EDC to be requested by the LRA in Zone 7 or in the Port facilities in Zone 6.
1. Department of Environmental and Natural Resources. 4,250¹ acres for conservation through a public park PBC. The Department has indicated a willingness to work with other entities, such as the Puerto Rico Conservation Trust, to achieve its conservation goals. The LRA understands this is the best alternative.
2. Puerto Rico Conservation Trust. Medio Mundo and Daguao Reserves System. Approximately 4,250¹ acres (to be confirmed) in four conservation units: Daguao River Reserve, the Guayacan Conservation Area, the Medio Mundo and Punta Puerca Coastal and Marine Reserve, and the Piñero and Piñerito Islands. The LRA recognizes the need to protect the natural resources of the areas as essential to a successful Reuse Plan. The natural beauty and unspoiled resources in the surrounding areas are one of the main attractions for the use of developable lands in the base. The LRA believes that the Conservation Trust, a not for profit 501(c)(3) organization, would be the best steward of these lands. At the same time, the LRA understands that there is a strong sentiment in the community that these lands become public lands. The best approach would be to transfer the lands to the Department of Environmental and Natural Resources through a conservation conveyance, with the understanding that the Department will enter into a long term lease or a conservation easement with the Conservation Trust that will give the Trust the necessary flexibility and long-term guarantees to administer these lands. The LRA understands that some portions of the land identified by this interested party can also be protected even if it is disposed of through other mechanisms.
3. Municipality of Ceiba. Los Machos Beach. The LRA endorses the need to transfer the Los Machos Beach to the Municipality of Ceiba through a recreation PBC or a conservation conveyance.
4. Municipality of Ceiba. 300 acres around Los Machos Beach and Piñeros Island. The LRA believes the Municipality should have the opportunity to adminis-

D. Public Park or Recreation

The legal authority for this kind of transfer is codified at 40 U.S.C. § 550(c). There is a separate authority available to the Department of Defense to convey lands for conservation purposes under 10 U.S.C. § 2694a.

Roosevelt Roads Reuse Plan

ter some of the lands adjoining the beaches, for the enjoyment of its citizens and should receive these lands through a recreation PBC or conservation conveyance. The LRA encourages the Municipality to use displaced workers from the Base to administer the recreational facilities in this area. Because the Conservation Trust has also requested the opportunity to administer Piñeros Island, the LRA encourages the Municipality of Ceiba to reach an agreement with the Conservation Trust, that will take advantage of the skills of the Trust in administering ecologically sensitive property, while still making the same accessible to the community.

5. Municipality of Ceiba. Marina. Buildings 2334, 467, 1724, 1716, the 72 slip marina and the adjoining lands. The Municipality would contract with the Cooperativa Marina Roosevelt Roads for the operation of this marina. Because there are concerns regarding the long-term operational viability of this marina under the strict requirements of a recreational PBC, the LRA believes it is best if the LRA applies to obtain the marina as a recreation PBC and the LRA would subsequently delegate the operation to another entity, which could be the members of the Cooperative Marina Roosevelt Roads if they present a viable plan. The LRA believes that the marina should be operated as a recreational and commercial marina, but the LRA believes that selection of an operator is best left to the marketplace.
6. Municipality of Ceiba. Golf Course. The LRA believes that the existing golf course should become a public course available to the community. The LRA, endorses the municipality's NOI for a PBC for the golf course, but encourages the municipality to explore options that will allow for the expansion to an 18 hole course.
7. JUPPA, Inc. Ecoparque la Seyba. Recreational and educational activities in 1,200 acres of unspecified wetlands, mangroves, estuaries and coastal areas. The LRA encourages the Conservation Trust to contact

and work with organizations interested in promoting educational activities in the ecologically valuable lands of Roosevelt Roads.

E. Airport

The legal authority for this kind of transfer is codified at 49 U.S.C. § 47151.

1. Puerto Rico Ports Authority. Use of runway and surrounding facilities for a civilian cargo and passenger airport. The LRA recognizes the airport as one of the most significant assets in the base and strongly supports its transfer to the Puerto Rico Ports Authority under a PBC that would allow for a self-sufficient airport operation.

F. Maritime Port

The legal authority for this kind of transfer is codified at 40 U.S.C. § 554.

1. Puerto Rico Ports Authority. Maritime Port. Port area from Pier 1 to Pier 3 and adjoining lands and buildings SW of Forrestal Drive, and the related tank farm. The LRA supports the use of these facilities as a combined cargo and passenger operation, including transfer of the cargo and passenger ferry operation from Fajardo. The LRA supports transferring these facilities to the Puerto Rico Ports Authority as a Port PBC. The NOI also includes the port area NW of Pier 1, but this area was transferred to the Customs Service and is not available for reuse.

G. Other

During the May 18, 2004 workshop on the NOI process, a number of entities expressed interest in promoting projects that did not fit into any of the PBC categories recognized in the law. Some of these projects involved

Roosevelt Roads Reuse Plan

particular private businesses. Participants were advised that, pursuant to the BRAC law, the EDC mechanism was available only to the LRA itself, but that in order to educate the LRA as to the kinds of business enterprises that could be located in NSRR participants were encouraged to use the NOI format to submit some of these ideas to the LRA. In drafting its Reuse Plan, the LRA has used this information as one additional reference point.

1. Aeolus Corporation. Energy powered by windmills. This NOI is labeled as a PBC, but since Aeolus Corporation is a private business it would not qualify or be eligible for a PBC. The interest of this business, however, has been noted by the LRA and the proponent is encouraged to keep himself informed of the property disposition process.
2. Tactical K-9 Services. K-9 unit training facility. This NOI is labeled as a PBC, but since Tactical K-9 services is a private business it would not qualify or be eligible for a PBC. The interest of this business, however, has been noted by the LRA and the proponent is encouraged to keep himself informed of the property disposition process.
3. National Oceanographic and Atmospheric Administration (“NOAA”). Caribbean Marine Science, Biotechnology and Aquaculture Center. As a Federal Agency, NOAA is not eligible for a PBC, but they were encouraged to submit information to the LRA through the NOI process, to alert the LRA as to potential uses for the property. This proposal is consistent with the LRA’s plans to develop a science park in Zone 7. The LRA will be requesting an EDC of an area within this Zone, where the activities described by this proponent could be undertaken.
4. Phazer-A-Tact Systems, Inc. Tactical security monitoring corporation. Since the proponent is a private business it would not qualify or be eligible for a PBC. The interest of this business, however, has been noted by the LRA and the proponent is encouraged to keep himself informed of the property disposition process.
5. Ceiba Housing and Economic Development Corporation. Navy Lodge and Bowling Center. This proposal does not qualify and is not eligible as a PBC. It is also outside of the area where the LRA intends to propose an EDC to the Navy. The LRA also believes that these properties should be administered by entities with more experience in administering these types of facilities and that it is best determined through the regular property disposition process. The LRA, however, believes that the Navy Lodge should remain as a lodging facility. The LRA would like to see the bowling center remain as such, but its ultimate use is best left to the market.

A.a Economic and Real Estate Overview Analysis

A.b Environmental, Transportation and Infrastructure Assessment

A.c Existing Building Assessment

A.I Introduction

IN AUGUST 2003, the Department of Economic Development and Commerce of the Commonwealth of Puerto Rico retained a consulting team lead by CB Richard Ellis Consulting to assist in identifying reuse opportunities for Naval Station Roosevelt Roads (NSRR). In late September 2003, the U.S. Congress ordered the Secretary of the Navy to close NSRR within six months and to do so pursuant to the Defense Base Realignment and Closure Act of 1990 (“BRAC”). That event triggered a series of actions organized around the need to prepare a Reuse Plan for the base. The CB Richard Ellis Consulting team is now assisting the Local Redevelopment Authority in preparing the Reuse Plan.

The Consulting Team is composed of:

- CB Richard Ellis Consulting: Real Estate and Development Advisors
- Cooper, Robertson & Partners: Architecture and Urban Design
- Moffatt & Nichol Engineers: Engineering
- Puerto Rico Management & Economic Consultants, Inc.: Economics

This progress report focuses on an analysis of existing conditions at the base and on the potential market support for its reuse. Specifically, it addresses the site's location, physical condition and natural features; buildings; infrastructure; transportation systems; environmental considerations; and the economic and real estate market conditions that will influence the likelihood of attracting an array of different land uses (e.g. residential, hotel, industrial, manufacturing, research and development, marina, etc.) to the site. The findings from this report will be used as a basis for developing reuse alternatives and, ultimately, for formulating a preferred reuse plan.

Report Organization

This report is designed to present the results of the Consulting Team's assessment of existing conditions and focused market analysis. In order to provide as concise a report as possible, we have captured summary level information in the body of the report while providing detailed data and back-up material in the appendices.

Following this introduction, the report is organized as follows:

- Executive summary
- Overview of location, physical conditions and natural features
- Potential development areas
- Opportunities and constraints

Information contained in the appendices includes: real estate market analysis; environmental, transportation and infrastructure assessment; and an assessment of existing buildings.

Important Notice

A great deal of the material obtained and reviewed by the Consulting Team comes from documents provided by governmental agencies including the Department of the Navy and various consultants. In reviewing these documents, the Consulting Team found certain conflicting information related to a number of conditions including, for example, the location of wetlands, mangroves, and bird habitats. Efforts are currently under way to resolve the inconsistencies in order to better understand the existing site conditions that will influence reuse opportunities.

For these reasons, the information in this progress report should be treated as preliminary only and subject to revision as additional information becomes known. Together with the Local Redevelopment Authority (LRA), the Consulting Team is trying to move quickly to understand the site to the degree necessary to identify realistic reuse options. The NEPA process (National Environmental Policy Act) and work by other consultants retained by the LRA should help facilitate resolution of the many environmental issues surrounding the site.

In conclusion, it would be inappropriate and premature to reach conclusions and begin to advocate a specific reuse scenario until the outstanding issues are resolved. This progress report is intended primarily for the benefit of the LRA as it works with the Consulting Team to formulate a Reuse Plan.

A.II Executive Summary

This summary presents preliminary findings and conclusions related to each of the subject areas analyzed by the Consultant Team including:

- Location, physical conditions and natural features
- Economic and market analysis
- Environmental, transportation and infrastructure
- Existing buildings

Location, Physical Conditions & Natural Features

The Consultant Team conducted an overview of adjacent neighborhoods, the site's physical conditions and natural features order to identify the physical development opportunities and constraints associated with the reuse of Roosevelt Roads. Our team collected and reviewed base and facilities drawings, documents and previous studies and other secondary sources provided by the Navy, other agencies and conservation groups. Amplified by field notes and photographs taken during our field trips to the site, the team's work effort results in a series of analytic drawings illustrating these physical informational layers, and which provide an understanding of the site's unique characteristics, its development constraints and an introduction to the opportunities for future reuse.

Elements considered in the overview included regional and local context, site structure, dimensions, topography and hydrology, existing vegetation, wetlands and ecology, and archeological sites. Existing land uses and supporting infrastructure were identified and mapped, as were the site's varying gradients, which must be considered when identifying areas for potential development. These conditions were then organized as a series of overlays, culminating in a summary of Constraints and Opportunities for future reuse of the base. (A separate section on Existing Building Assessment is included in Appendix C).

Our findings from this investigation are included in Sections III, IV and V of this report and are summarized below:

- The site is at the physical center of the Eastern Caribbean region. Excellent air and ship transportation is readily available; San Juan is one of the busiest and largest air, cruise and cargo ports in the region. The Roosevelt Roads site has the advantage of proximity to existing and new tourist resorts and second home market developing along the eastern coast, as well as to Vieques and Culebra, both in sight of the base, across the sound.
- At the foothills of El Yunque and at the edge of the sea, Roosevelt Roads is intrinsically linked to its regional ecology of rainforests, marine habitat, migratory birds, and coastal flora. There is the opportunity to augment a widely recognized emerging regional eco-tourism, forming a regional recreational linkage with such tourist sites both within Puerto Rico, Vieques and Culebra, and the islands of the Greater Antilles Archipelago.
- Ceiba and Naguabo are small neighboring coastal towns, both formerly agricultural, and now primarily residential in character, with supporting small-scale retail and institutional facilities. These towns are visibly impacted by the closure of the Naval operations at Roosevelt Roads, with For Sale signs proliferating throughout the residential streets and neighborhoods and now along some of the prime retail sites at the center of town. There is little industry in either town; both were dependent on the Navy for local employment. With the closure of the base, it appears that many local residents are relocating out of the immediate area. The town has enjoyed beach access and development of a fishing boat pier on property belonging to the Navy, to the east of the northern gate. A concern is how ownership of this portion of the property will be determined in the future.
- Access to the site is limited and circuitous at the northern end of the site and would require reconfiguration and wayfinding. Access to the southern gate from the regional road network is direct and well market. Of great advantage, there is the opportunity for direct access to the airport area, regardless of whether it remains an active airfield or is redeveloped for other purposes. The airfield has helipads and multiple runways, the longest over 11,000 feet in length, and as such, can accommodate virtually any size aircraft. While the airfield today is visually screened from outlying areas by heavy vegetation, it could become visible to the main highway with selective tree thinning creating value for new commercial development activity.
- One of the largest coastal properties in Puerto Rico remaining in single ownership, the site encompasses a sweeping 8,300 acres on mainland Puerto Rico plus two smaller islands, Isla Pineros Isla and Cabeza de Perro that together represent some 300 additional acres. The site geographically is the easternmost extension of the foothills of El Yunque, forming notable, twin “booted” peninsulas that together frame Ensenada Honda, the large and well-protected harbor at the center of the site with a distinctive ring of hills, nearly 300 feet at the highest point. A smaller bay, Bahía de Puerca, presents a second “outboard” opportunity for water-related activity and adjacent development.
- Limited largely by topography and mangrove forest preserves, opportunity for direct access to the water is restricted to a few locations at the site’s small but charming beachfronts, and along the extensively bulk-headed frontage of the harbor along the northern peninsula. Along this formerly industrial waterfront, the infrastructure is sufficient to support a variety of regionally appropriate uses, such as a passenger terminal to Vieques and Culebra.

- The encircling Delicias Hills influence the direction of the site's surface water drainage in addition to providing dramatic water and coastal views to the north and south. They also serve to contain noise generated by activity at the airfield, which is located in the site's major north-east/southwest valley. Dual views of El Yunque to the west and Island Pineros and Vieques to the east are equally compelling, and can be best seen from two spectacular vantage points, Punto Medio Mundo, jutting into the bay at the northernmost high point of the site, and at the site's dramatic northern eastern "heel" on the peninsula, among the most valuable on the site.
- The richness of natural diversity, of natural flora, extensive wetlands, mangrove forests and surrounding sea grass beds, underscores multiple ecologies and biodiversity present at the site. The site is an important coastal resource and potential habitat for a number of threatened and endangered species including the Yellow Shouldered Blackbird and the West Indian Manatee. Again, under single ownership, this presents a unique opportunity for conservation as well as development. Additionally, there are a number of listed archeological sites potentially warranting future investigation.
- Existing development at the base falls within six fragmented zones separated by topography, wetlands or land use: the airfield, Bundy to the southwest, "Downtown" at the center of the site, Capehart (residential neighborhoods on the southern peninsula), the waterfront along the northern bulkhead of Ensenada Honda, and Camp Moscrip at the edge of Bahia de Puerca. Each area is dominated by a single land use with supporting adjacent facilities; each is adaptable to reuse or appropriate for redevelopment. Support facilities at the base are diverse and include a recently renovated hospital, a well-equipped ambulatory care medical and dental facility, two air-conditioned schools, libraries, a theater, a public works building, refrigerated storage areas, commercial buildings of varying sizes and recreational facilities that include tennis courts, small-boat marina, fitness center, a 9-hole golf course and a variety of ball fields. As with most military installations and with few exceptions, base facilities were developed with little regard to aesthetic quality or siting, designed to be purely functional and operationally necessary, with minimal support facilities. It is an environment of mostly well-maintained, "no-frills" structures and facilities.
- Infrastructure at the base was developed in support of specific land uses and zones, and while adequate to support reuse, it is likely that with reuse of the base, elements of existing infrastructure will require updating and modification, particularly roads, which are not designed to service significant traffic generated by private vehicles, and piers, which are sized to service naval and tanker vessels not passenger ferries or private charter boats.
- With much of the site falling within wetland areas, the 100-year floodplain and areas with greater than 15% gradient or in existing development or the 521 acres reserved for new development at the airport, new development is limited 1,208 acres throughout the remainder of the site.
- Areas of concern (AOCs) related to the presence of potential contaminants, and solid waste management units (SWMUs) require further definition and clarification, and will present significant constraint to future development. The Navy's Environmental Assessment, currently underway, will provide additional information regarding these areas, and the scope of potential cleanup.

Economic and Market Analysis

The Consulting Team conducted an economic and real estate market overview in order to assess the market opportunities and constraints likely to be associated with the reuse of Roosevelt Roads. Uses considered in the market analysis included research and development (science park), industrial, retail, lodging, cruise ship terminal, marinas, nautical tourism, and residential. The anticipated outcome of this overview is the identification of the types of land uses that are likely to be supported from a market perspective. Findings and preliminary conclusions from the market analysis are presented in detail in Appendix A and are summarized below.

- Some of the uses considered are more likely to be supportable in the near-term while others will require a longer-term perspective to find market acceptance. Market findings indicate that supportable near-term uses, including reuse of some existing buildings, include:
 - Residential
 - Research and development in the form of university sponsored research and educational programs
 - Industrial including distribution, warehouse and, perhaps, some manufacturing
 - Marina
 - Eco-tourism activities
- In the longer-term, several additional uses could be supportable as demand grows and as the market acknowledges the success of early projects at Roosevelt Roads. These other uses could include:
 - Resort hotels
 - Specialty retail/restaurants in a marina and tourist port setting
 - Convenience retail (i.e. a grocery store-anchored neighborhood shopping center) to serve the needs of local residents living at Roosevelt Roads and in immediately surrounding neighborhoods
- Current residential market conditions in the Fajardo/Ceiba Region are depressed, with declining prices and increased vacancy, which are due primarily to the closure of Roosevelt Roads and the departure of associated military and civilian jobs. In the near term, Roosevelt Roads is not proximate to job centers, which will temper demand for housing. However, the Fajardo/Ceiba Region is projected to require 13,000 new housing units by 2025 to keep up with population growth. Therefore, future demand for housing located at Roosevelt Roads could be strong, either for re-use of current housing or construction of new units, especially as jobs are attracted to Roosevelt Roads over time. The site attributes of Roosevelt Roads, including spectacular views and existing infrastructure including schools, hospital, etc., as well as the future improvements in access to San Juan via new highway construction, could make the site an attractive location for both the primary and second-home markets.
- Past case study research performed by CBRE Consulting indicates that Roosevelt Roads has many of the attributes necessary for a Science Park. There has been preliminary interest expressed by both the University of Puerto Rico and the Polytechnic University of Puerto Rico in locating select research and development efforts on the site. If one of the universities were to serve as an anchor for the park, the ability to attract additional public and private sector tenants would be greatly enhanced.
- Potential demand for industrial development at Roosevelt Roads appears to be somewhat limited based

on the current supply of general-purpose industrial buildings in the Fajardo/Ceiba Region and the corresponding vacancy rate in the Region. However, Roosevelt Roads does have an advantage in the presence of the base airport, which could be attractive to industrial users. Additionally, Roosevelt Roads has the potential to attract industrial owner-occupiers, such as pharmaceutical and high technology manufacturers.

- There appears to be good potential for a marina at Roosevelt Roads given its location within the Fajardo/Ceiba Region, where many of Puerto Rico's marinas are concentrated, as well as its proximity to Vieques and Culebra. However, the marina inventory in the eastern region could be increasing significantly in the coming years if proposed expansion plans at various marinas are executed, which could temper demand at Roosevelt Roads.
- Roosevelt Roads has several attributes that support the potential for ecotourism on the site, including existing mangroves that may be explored by hiking and/or kayaking excursions, canoeing and other forms of boating that may be launched from the existing marina on the site, and ecotourism-oriented visits that could be organized to the islands off the northeast coast of Puerto Rico, such as Vieques and Culebra. Given its location, coastal setting, and environmentally sensitive areas, Roosevelt Roads could be well positioned to cater to this growing tourism sector.
- The lodging market in Puerto Rico has been stable or growing throughout the past ten years, as evidenced by the steady growth in the inventory of hotel rooms on the

island. The Fajardo/Ceiba Region is known for its access to activities and amenities such as El Yunque, the sister islands of Vieques and Culebra, and water sport activities and golf, and is anticipated to experience increasing demand in the lodging market. Such demand could be captured by a potential lodging development at Roosevelt Roads, which could capitalize on the beauty of the site, its proximity to Vieques, and Culebra, and complementary land uses (such as a marina and a golf course) that could be accommodated nearby.

- Due to a lack of expressway visibility and direct access, the location of Roosevelt Roads does not lend itself to major shopping center development. However, the site does have characteristics that could support other types of retail development. There will be potential for a grocery-anchored neighborhood shopping center supported by local residents currently living in the area and future residents at Roosevelt Roads, once there are a significant number of occupied homes on the site. Additionally, specialty retail, adjacent to the water, could also be supportable if it is developed with the appropriate mix of adjacent uses (e.g., residential, marina, lodging, and tourist-oriented facilities).
- Due to Puerto Rico's location within the Eastern Caribbean, most cruise ships that make port of call stops in San Juan do so for only a partial day, often in the afternoon and evening. As a result, San Juan is an attractive destination because passengers can enjoy city activities during their brief time on the island. Interviews with planning executives at two major cruise lines indicate that there is not sufficient demand for a cruise ship terminal at Roosevelt Roads because of the site's disadvantageous location from an itinerary planning perspective.

Environmental, Transportation, and Infrastructure

The Consulting Team was tasked with reviewing existing data on infrastructure at NSRR, and supplementing with field notes and photos during field trips to the site. The team collected existing reports, base maps, coastal charts, construction plans, and utility information to ascertain that the general infrastructure of the base is currently adequate to support the existing development on the base, and has capacity to support additional development. The specifics of the surplus capacity will be studied during the alternatives analyses. Appendix B of this report details specifics of the base infrastructure, in addition to documenting environmental considerations and regional transportation system. The most important aspects of this desktop study and of Appendix B are summarized below.

- NSRR is a fully functioning base, with adequate infrastructure systems to convey potable water, fire water and power to buildings and facilities. The systems have been developed and maintained in accordance with or above the standard of care.
- Base wastewater is treated and discharged and is fully permitted under a National Pollution Discharge Elimination System permit. With the decommissioning of the base, the sanitary system will cease to be operational. If any one of the three wastewater systems ceases to be operational, the NPDES permit will become invalid. Keeping the permit valid is of key importance, since applying for and obtaining new permits for wastewater treatment and discharge is a long and arduous process. The NSRR Public Works Department plans to “mothball” and maintain equipment for the next two years.
- Base maintenance for other systems is also important. The buildings will quickly succumb to mildew and rot without minimum level of air conditioning.
- The base receives its water from a pipeline from Rio Blanco in the El Yunque Mountains. The raw water is treated and distributed throughout the base. Monitoring data for trihalomethanes (THMs) at the discharge of the treatment plant and at remote points on the water distribution system show that the addition of chlorine for disinfection at the plant is causing the formation of this organic chemical contaminant at unacceptable concentrations. THMs may be controlled by various techniques, including enhanced treatment process control, removal of the precursor organic chemicals, elimination of chlorine as the disinfecting agent or removal of the fully formed THMs by physical or chemical treatment. This should be evaluated further with regard to regulations governing Roosevelt Roads.
- NSRR, on mainland Puerto Rico, is approximately 8,600 acres in area. This area consists of military installations, residential regions, an airfield, wetlands and floodplains. Approximately 4,250 acres, or 53% of the total area, consists of mangroves, seagrass beds, natural animal habitats and other environmentally sensitive areas.
- An Area of Concern (AOC) is an area identified for possible contamination. If confirmation of contamination is obtained, the area becomes a Solid Waste Management Unit (SWMU). A process is currently in place for identifying and designating SWMUs and AOCs on the base. It is the subject of a concurrent study being completed by the LRA. For the purposes of this report, AOC and SWMU locations are not necessarily eliminated from consideration for development, since they can be remediated.
- The marine infrastructure of the base consists of 6 piers, bulkheading, one drydock, and a landing ship tank (LST) ramp. The pier adjacent to the drydock is dilapidated and does not lend itself to remediation. The visible features of the drydock, those above the waterline, are in

a state of disrepair. The remaining piers, bulkhead and LST ramp are or were recently operational, and have been maintained.

- The federal channel to Ensenada Honda is maintained to a depth of 40 ft Mean Sea Level (MSL). This is not considered a deepwater commercial port, which would be on the order of 50 ft below MSL.
- There is a 72 slip marina on base that was constructed in the mid-1990s. Each ship service box provides potable water and 110 V power. Conduit has been placed for cable television but cables were never installed. The average depth at the seawall is approximately 6–8 feet. The facility is generally in good condition as it is relatively new.
- The airfield at Roosevelt Roads has several runways, the longest of which is 11,000 feet. Future development around the runway must respect hazard zones and noise zones. These are documented in Appendix B.

Existing Building Assessment

The Team assessed the existing facilities on the base using data supplied by the Navy and on-site inspections during February 2004. One outcome of these studies and investigations was the realization that approximately 10% of the 1,600 facilities on the Base have not yet been mapped and documented to the same degree as the remaining 90%. The team is in the process of attempting to verify information about these "Unconfirmed" facilities. That said, a number of conclusions can still be drawn regarding the existing facilities at Roosevelt Roads.

The facilities were built over the course of the past 65 years from the beginnings of the Base in the late 1930s

right up until the present. Approximately 75% of the buildings were built before the end of the 1960s. Most of the built facilities at Roosevelt Roads have been adequately maintained over the years and are in good condition.

A small but significant number of facilities are considered essential for continued operation of the Base infrastructure, airport or seaport. In addition, 29% of the remaining facilities are judged to be of high economic value due to their unique characteristics. Taken together these figures total more than 500 facilities spread out over the entire Base. The cost of maintaining this large number of essential or economically valuable facilities will be significant.

The remaining facilities comprise more than 1,000 structures currently serving a myriad of uses by the Navy. Because their physical condition, quality of construction and location vary considerably, their future usefulness will depend largely on the specific re-use plans developed and implemented. Again, the sheer number of facilities falling into this category will make even minimal maintenance a costly endeavor. Serious consideration will have to be given to demolition of facilities that are not either used or minimally maintained in the near future to limit the cost of stabilizing and securing such a vast number of structures.

In terms of re-use of the existing facilities approximately 98% of the Net Square Footage (NSF) on the Base could be used for civilian purposes. Approximately 60% of this Square Footage (SF) consists of Residential, Institutional and Recreational facilities. The remainder is comprised largely of Commercial and Industrial facilities including offices, stores, warehouses, workshops, etc. Most of these can be readily adapted to serve any number of uses depending on the final re-use plans adopted.

A.III Overview: Location, Physical Condition, Natural Features

Every property is unique; its precise location and a broad range of physical characteristics combine to form the essential qualities of any given site.

The consulting team has reviewed a number of detailed environmental assessments of the site, extensively toured the site and has researched a number of the site's physical characteristics. The following chapter focuses on the key findings with respect to the physical nature of the site. It is then followed by a study of the existing facilities, infrastructure, land uses and development potential.

Location *Regional Context: The Caribbean*

Puerto Rico is strategically located as the easternmost island of the Greater Antilles, centrally located among the eastern Caribbean archipelago. It enjoys excellent access from the U.S. Mainland via air and water transportation, and is a jumping off point to neighboring U.S. and British Virgin Islands, as well as Anguilla, Nevis and St. Kitts and the West Indies.

Among the larger islands in the Caribbean islands Puerto Rico is approximately 110 miles long and 55 miles wide and has a population that is approaching 4 million residents.

The Atlantic Ocean lies off the northern coast of Puerto Rico, the Caribbean Sea off the southern coast. Off the coast of the eastern portion of the island, two significantly sized islands, Vieques and Culebra, are separated from mainland Puerto Rico by surrounding bays, Passages de Vieques and the Sonda de Vieques.

Figure III.1
Location Context

Sources: Puerto Rico Planning Board, and CBRE Consulting

Island Context: Gold Coast

The eastern side of the island is characterized by a topographically dramatic juxtaposition of tropical rainforest and beaches framed by mangrove preserves and steeply sloping promontories affording unparalleled waterfront views.

With its peak of 3533' above sea level, El Yunque and the Caribbean National Forest in the Sierra de Luquillo Mountains is visible from nearly every venue at Roosevelt Roads, presenting a dramatic backdrop to the west, often concealed in the clouds. Its terrain changes from gentle slopes at lower elevations to deeply vegetated and rock-faced mountain slopes that exceed 60% gradient at higher elevations. To the east, the craggy coastline is characterized by distinctive heavily-vegetated and steeply sloping peninsulas framing bays and coves and limited beach accessibility.

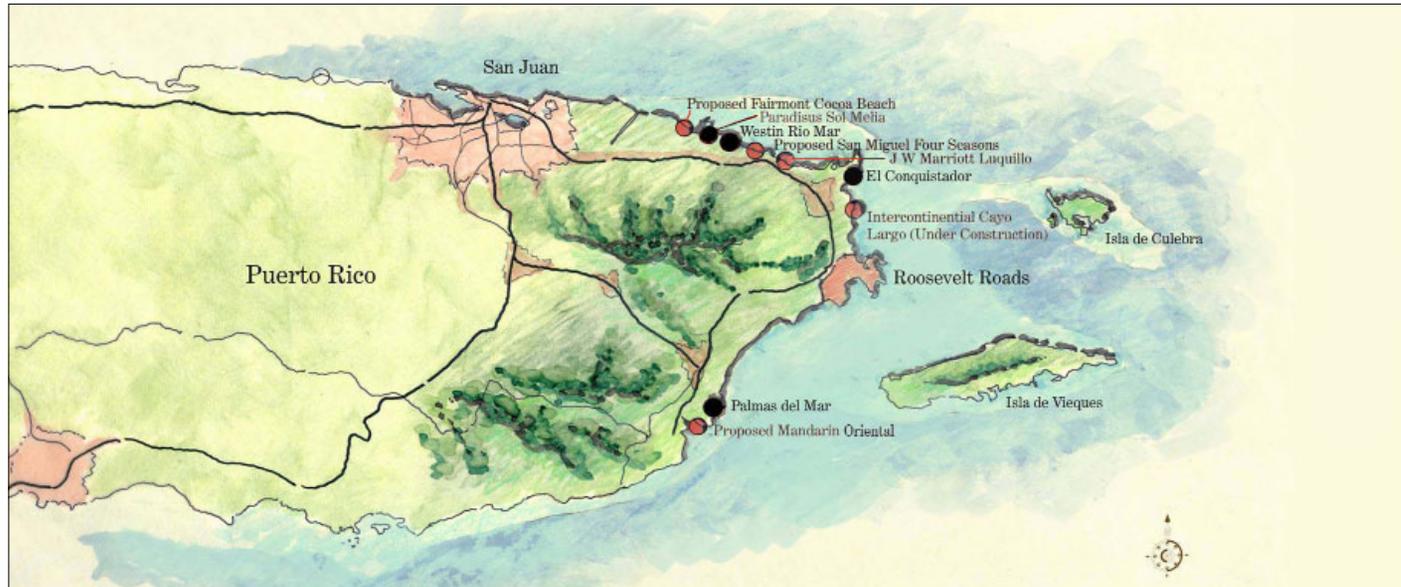

Figure III.2
The Gold Coast

Sources: Puerto Rico Planning Board; and CBRE Consulting

Roosevelt Roads Reuse Plan: Site, Context, & Market Conditions

Approximately thirty-three (33) miles southeast of San Juan, Roosevelt Roads is situated mid-east coast, equidistant along the Gold Coast between the resorts to the northeast, including the Westin Rio Mar and Paradisus Sol Melia, and the proposed Fairmont, Four Season, J.W. Marriott, and Intercontinental properties; and those to the southeast, Palmas del Mar and the proposed Mandarin Oriental Resort near Humacao. The emerging resorts on Vieques and Culebra are accessed by ferry from Fajardo, a large town on the eight miles north of the property.

Puerto del Rey, one of the Caribbean's major recreational marinas is located less than three miles to the north of Roosevelt Roads. Ensenada Honda is one of the Gold Coast's most unspoiled and significant bays and lies at the center of the Roosevelt Roads property. The bay is twelve (12) nautical miles from Isabel Segunda on the north coast of Vieques and six (6) miles from its southwestern pier. It is also forty-four (44) nautical miles from St. Thomas; sixty (60) nautical miles from Christiansted, St. Croix; and sixty-five (65) miles from Tortola, BVI.

Roosevelt Roads Reuse Plan: Site, Context, & Market Conditions

Local Context: Surrounding Neighborhoods Ceiba and Naguabo

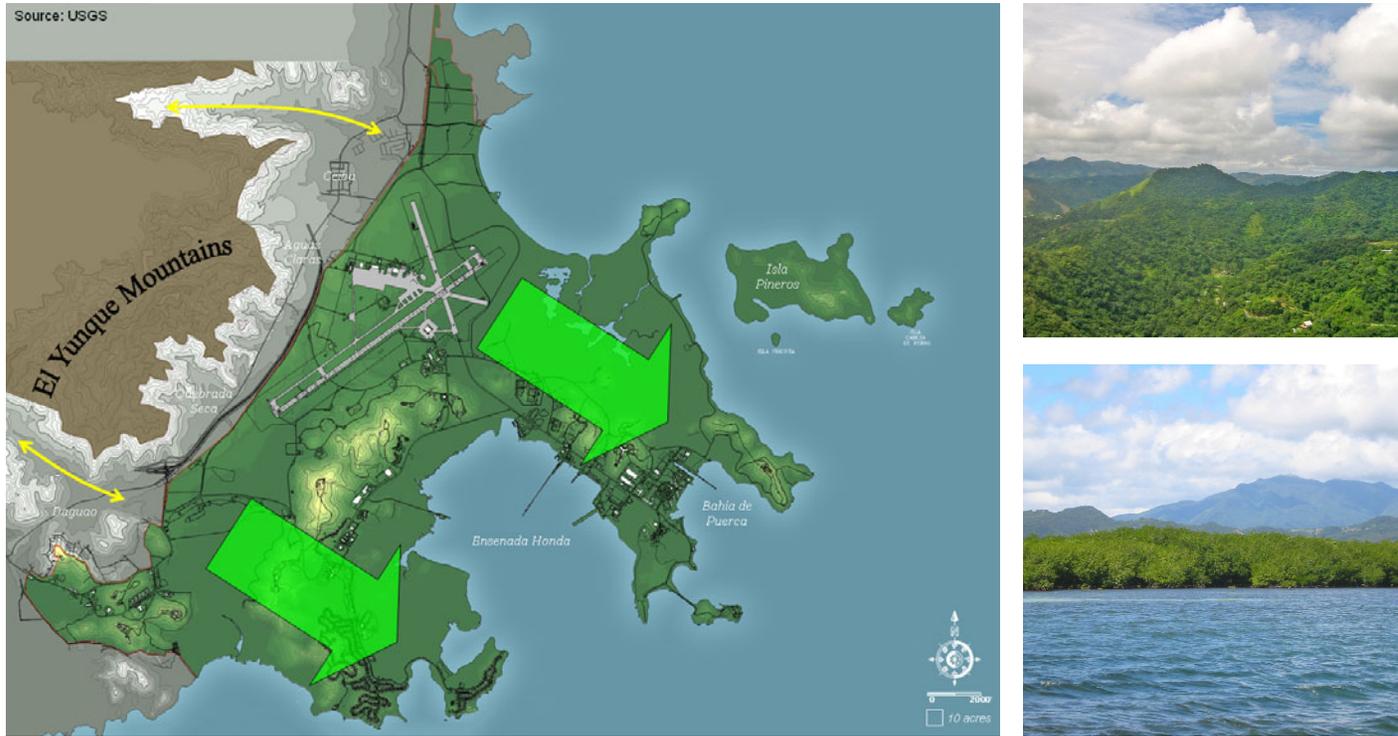

Two small neighboring towns, Ceiba to the west of the Roosevelt Roads Naval Base and Naguabo to the south are the nearest centers of local population. Ceiba, founded in 1838, derives its name from the name of a famous tree that grows on the island, Ceiba Pentandra.

Both Ceiba and Naguabo were rooted to agriculture as their main source of economic activity prior to the Navy's siting of the Roosevelt Roads Naval Base in the 1940s.

Figure III.3
Site Structure

Source: USGS

Site Structure

The site is a natural extension of the continuous foothills of the rainforest, forming a visually powerful backdrop and termination of the rainforest watershed.

Ensenada Harbor, the large sound at the center of the site is framed by dual southeast-oriented peninsulas, typical of the geographic character of Puerto Rico's eastern shore. The northern peninsula is higher; its top elevation approaches 200' above sea level at its peak. The southern peninsula is somewhat lower in elevation and is completely ringed by mangroves at the water's edge with limited exception. A pair of "boots", the small points at the end of the peninsulas create parallel "islands" into the sea.

Bahía de Puerca, a small bay at the northern peninsula is a smaller-scale mirror version of the overall site, framed by two smaller waterfront promontories that orient toward the long vista toward Vieques.

Off the coast of the northern peninsula, two additional small islands are part of the property. The larger one, Isla Píneros, is 1 mile by ½ mile in dimension; Cabeza de Perro, the smaller one, is ¼ mile in diameter.

Physical Condition *Site Dimensions*

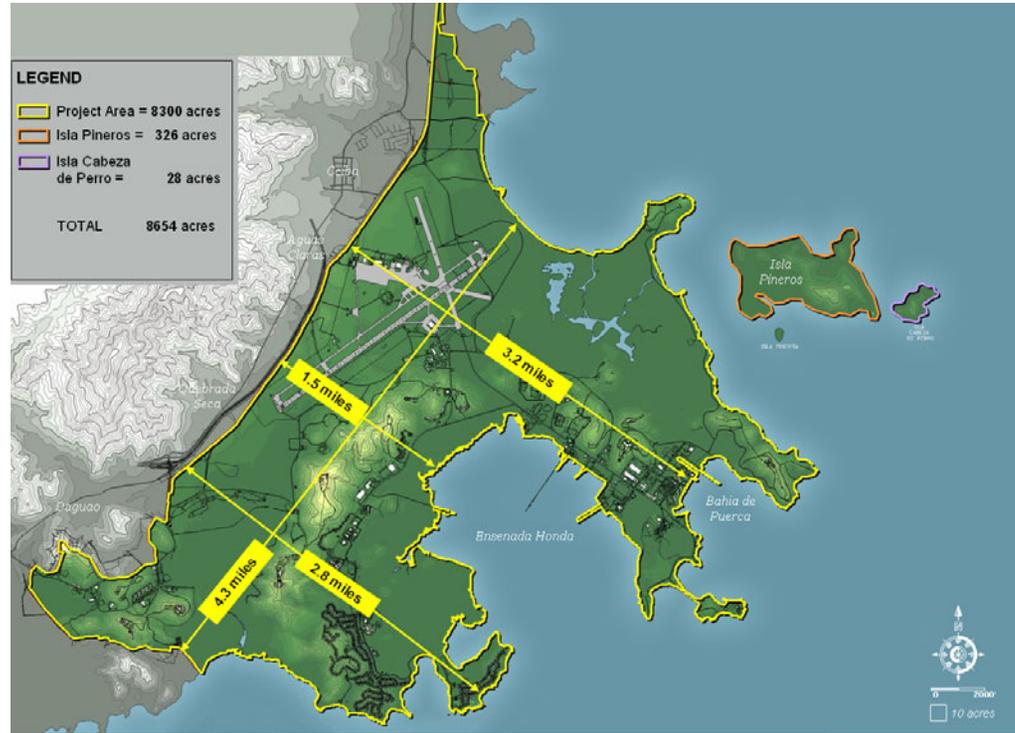

Figure III.4
Site Dimensions:

A remarkable expanse of coastal waterfront property, the Roosevelt Roads site encompasses just over 8,300 acres. Certainly this is one of the largest coastal properties under single ownership on the island.

In dimensions it measures nearly five miles across (north-east to southwest) and nearly four miles at its width (north-west to southeast). At its narrowest, the midsection of the site is 1.5 miles wide.

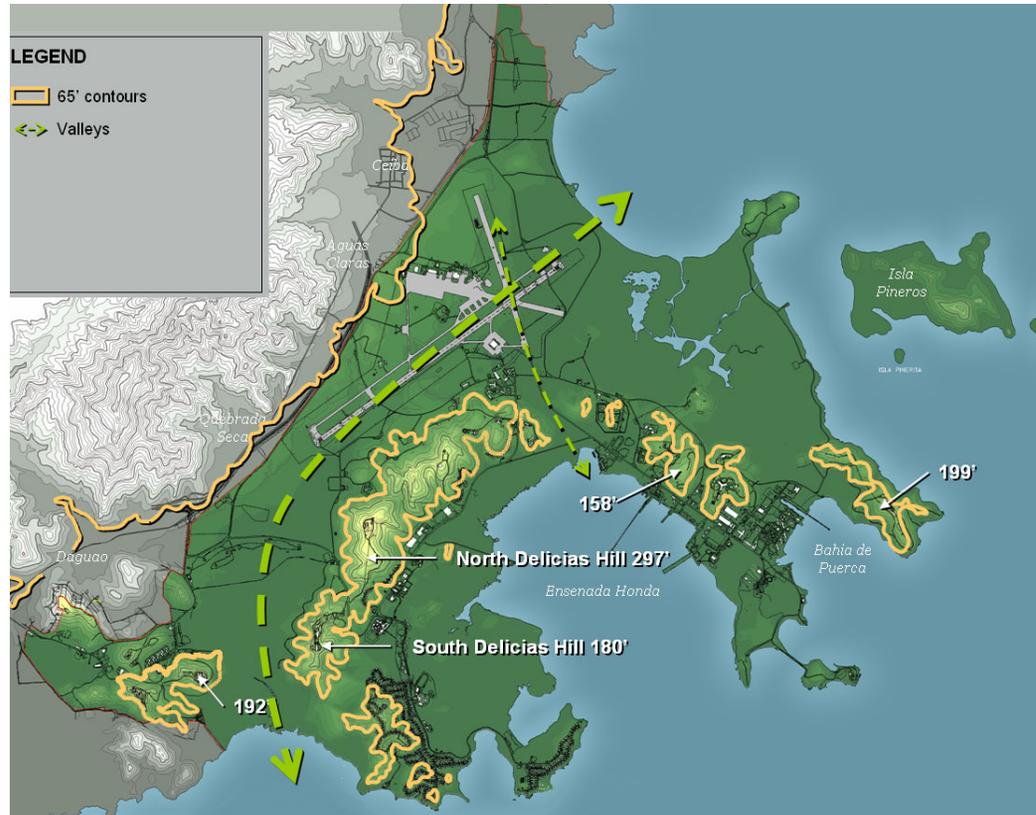

Ensenada Honda is a large and naturally protected harbor measuring roughly 1.25 miles wide by 2.15 miles long. The smaller Bahia de Puerca is exposed to the prevailing outboard swells and chop of open water; it measures approximately .5 miles wide by .7miles long.

Local Site Topography

Figure III.5
Local Site
Topography: Varied,
broad range from
sea level to 297' in
elevation

Sources: USGS,
BakerCAD

The site has a varied topographical aspect, typical of the eastern coastal properties of this region and the foothills of the rain-forest. There is a broad range in elevation from sea level to 297' vertical elevation at the high point in the middle of the site's central ridge.

The site's principal defining topographic feature is the distinctive ring of nearly continuous hills framing Ensenada Honda from the southern peninsula to the northern peninsula. At its midpoint in the center of the site is a high ridge dividing the upland airport from the harbor. On the central northern peninsula, the hills have been cut away to create a significantly sized building pad for the public works building.

The hills create major northeast/southwest valley, an ideal site to have aligned and located the well-protected, visually protected airfield with a naturally "built-in" wind screen. From the west, and the east, the airport's main runways are effectively hidden by topography, enhanced by dense vegetation. A secondary valley aligned along the northwest/southeast secondary runway alignment, penetrates the ring of hills.

Another cluster of hills at the southern end of the site afford substantial elevation and therefore views south toward Naguabo and Humacao.

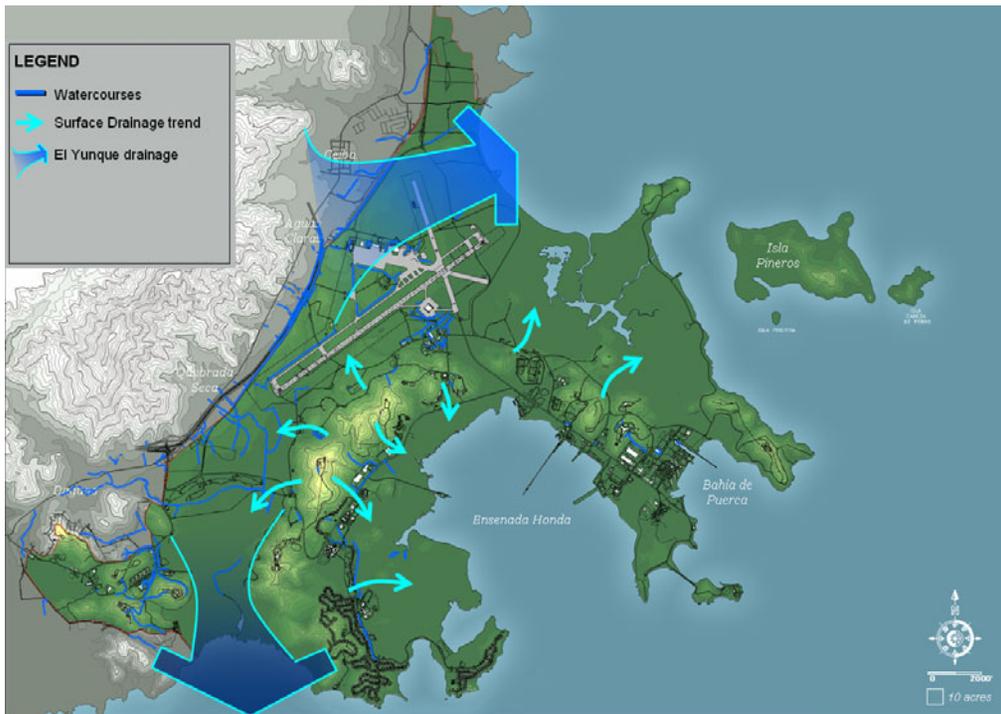

North of Bahia de Puerca, the site consists of a large rectangular high promontory of nearly 200' elevation above sea level. Surrounded by densely vegetated and steeply sloping terrain, this point has sweeping views overlooking the harbor, all of the surrounding and distant islands, and a singular view toward northern coastline to the recently restored Cabezas Lighthouse and to Fajardo.

Natural Features

Hydrology and Watercourses

Figure III.6
Hydrology and Watercourses: In the accompanying figure, large blue arrows indicate how larger regional ground water drainage patterns seek coastal outlet. Light blue arrows indicate general natural drainage patterns leading from Delicias Hills and the elevated areas of the site.

Source: BakerCAD

Generally, the subsurface at Roosevelt Roads is a combination of volcanic rock and a range of more permeable materials close in to the water's edge.

In the heavy rainfall that this part of Puerto Rico experiences annually, groundwater runoff will likely be accelerated because of these conditions.

The site's proximity to the sea results in a high presence of salinity in on-site ground water. Additionally, relatively slow recharge rates indicate poor suitability for generating potable water from local wells.

Water Depth

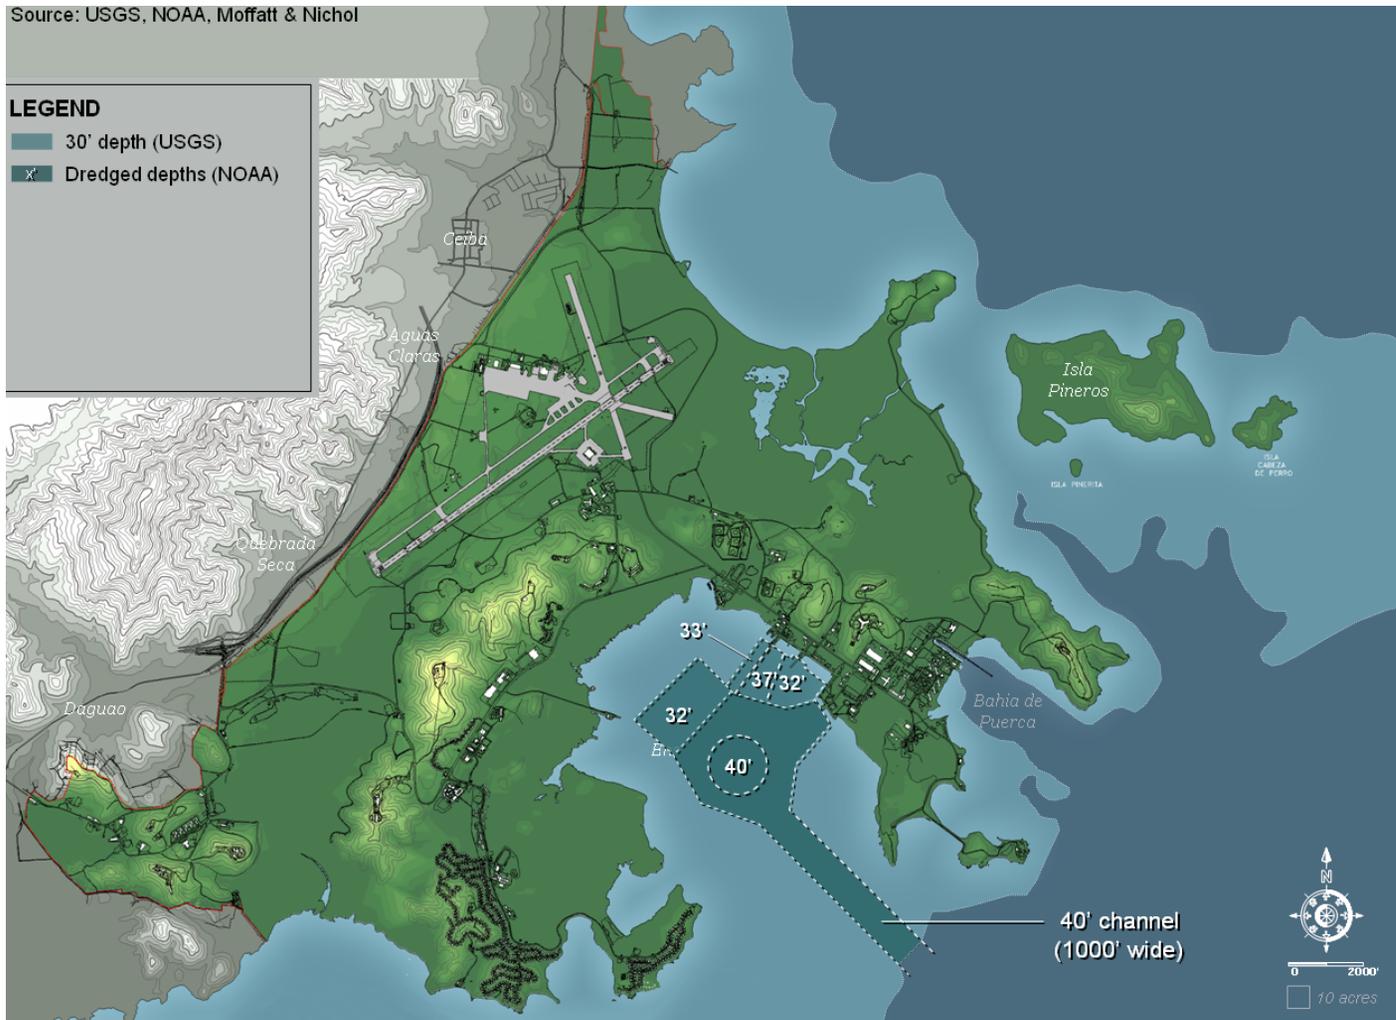

Figure III.7
Water Depth.
 For additional information on the central channel and condition of the piers, please refer to Appendix B.

Source: USGS, NOAA, Moffatt & Nichol

The site is surrounded by water on three sides. Along its extensive coastline, the depth of water at the coastal shelf is variable, and ranges from zero (0) to 30 feet. These shallow shelves extend up to 4000 linear feet off the coastline along the Puerto Medio Mundo, while deeper waters approach the north peninsula north of Bahía de Puerca. The shelf of up to 30' deep extends out 10,000' south of the southern peninsula.

There is an existing deep-water channel leading into the harbor, allowing larger vessels and fuel tankers access to the naval piers located along the northern edge of harbor.

Existing Vegetation

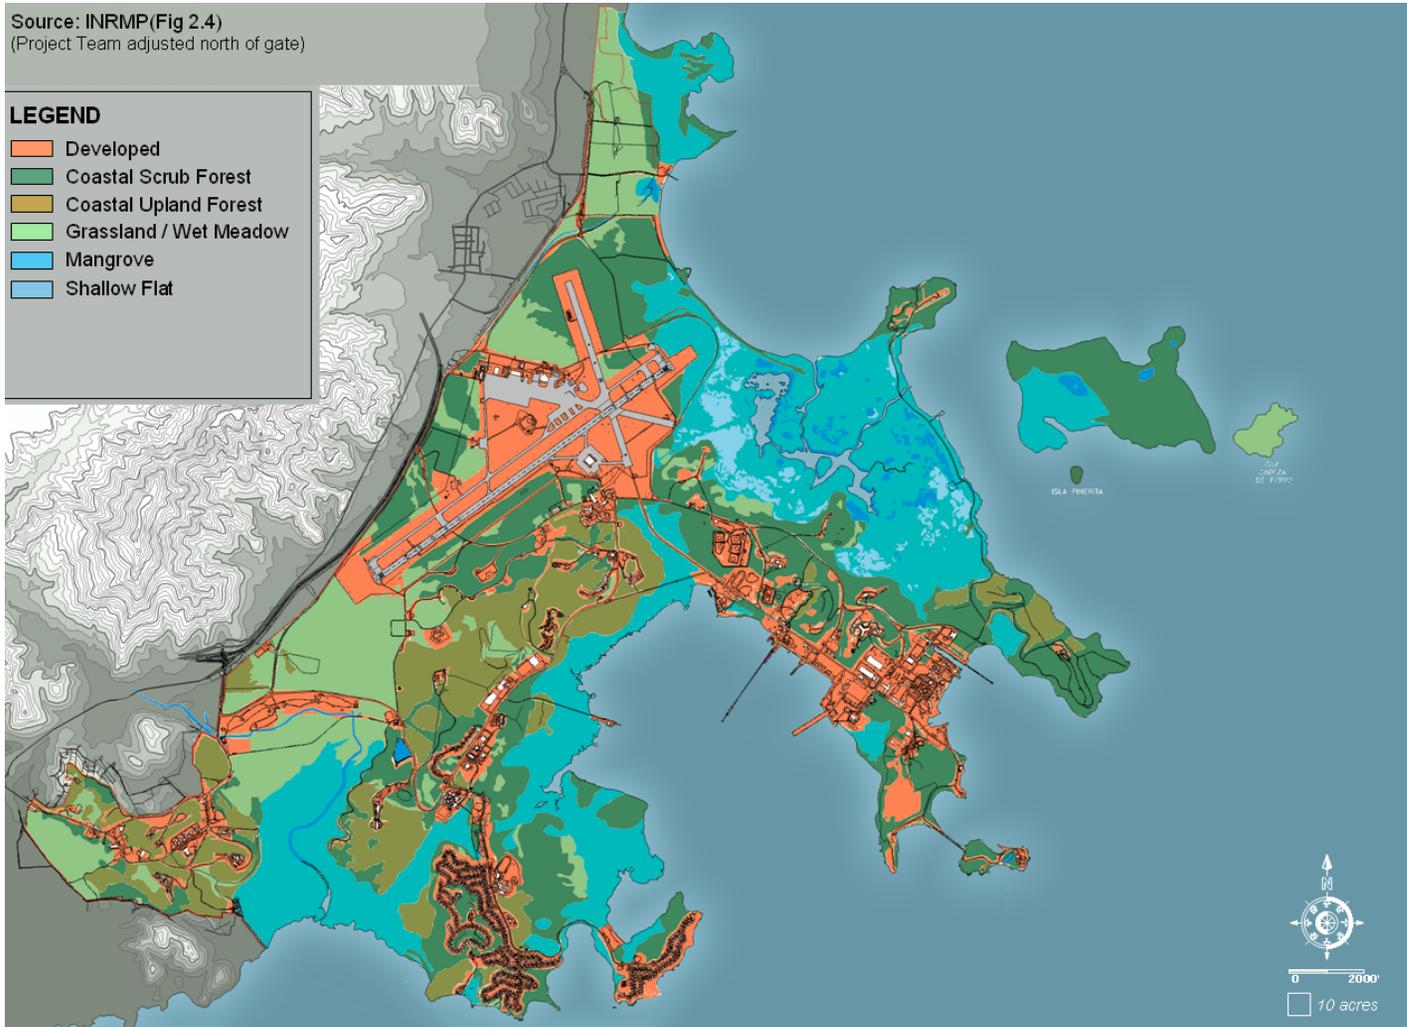

Figure III.8
Existing Vegetation

Source: INRMP (fig 2.4)
(Project Team adjusted north of gate)

Existing vegetation at Roosevelt Roads is richly diverse, reflecting the multiple adjacent ecologies present on the site. A variety of native flora species underscore the characteristic of the site's range of biodiversity: upland forests, coincident with higher elevations on the site; coastal scrub forest coincident with the mid-sections; grassy, meadowed

fresh water wetlands coincident with the inland floodplain; and coastal wetlands, coincident with the tidal "outboard" areas of the site. Of the 8,300 acres that comprise the site, approximately 2,900 acres are designated wetlands according to the recent ECP report, and of those 60% are mangroves, considered protected under Federal Law.

Roosevelt Roads Reuse Plan: Site, Context, & Market Conditions

The prevailing vegetation found along the coastal regions of eastern Puerto Rico and at Roosevelt Roads include:

- Upland and Coastal Scrub Forests: Native vegetation at the site includes small trees such as: leadtree, boxbriar, sweet acacia, Australian corkwood tree; larger trees including ucar, sand box, ficus, flamboyants, Puerto Rica Royal Palm, ginap and Indian almond. There is a predominance of successional stands of small trees, that are essential to enhancement of watershed protection areas and ground water recharge
- Grassland/Wet Meadow: this is predominant in the “valley” floor of the site to the northwest and southwest of the airport. Native species would include cattails, and a variety of grasses, a natural habitat for herons, egrets, coots, and fresh water turtles that are found in these areas.
- Mangrove and Shallow flats are distributed throughout the low-lying coastal areas of the site. Ambient average water temperature in these areas ranges from 75° to 84°. Typically, these areas require stable salinity of 35 parts per 1000, clear water allowing deep light penetration to enhance the quality of the habitat for a diversity of species. Sea grass beds, critical habitat for manatees, and the site’s coral reefs are prime candidates for conservation. The mangroves are essentially “self-maintaining” coastal landscape areas to the extent that they are protected from encroachment or pollution.

- Beach strand ecosystem: This occurs on slightly elevated sandy ridges that are seen in a few areas of the sight. Common shrubs include the bay cedar and the sea grape. Trees typically found in these areas include coconut, buttonbush and poisonous manzanillo.

According to the environmental assessments completed previously at the sight, a number of protected species that have inhabited undeveloped areas of Roosevelt Roads include:

Fauna

- ❑ West Indian Manatee.
- ❑ Yellow-Shouldered Blackbird
- ❑ Artic Peregrine
- ❑ Brown Pelican
- ❑ Roseate Tern
- ❑ Loggerhead Sea Turtle
- ❑ Green Sea Turtle
- ❑ Leatherback Sea Turtle
- ❑ Hawksbill Sea Turtle
- ❑ Puerto Rican Boa

Flora

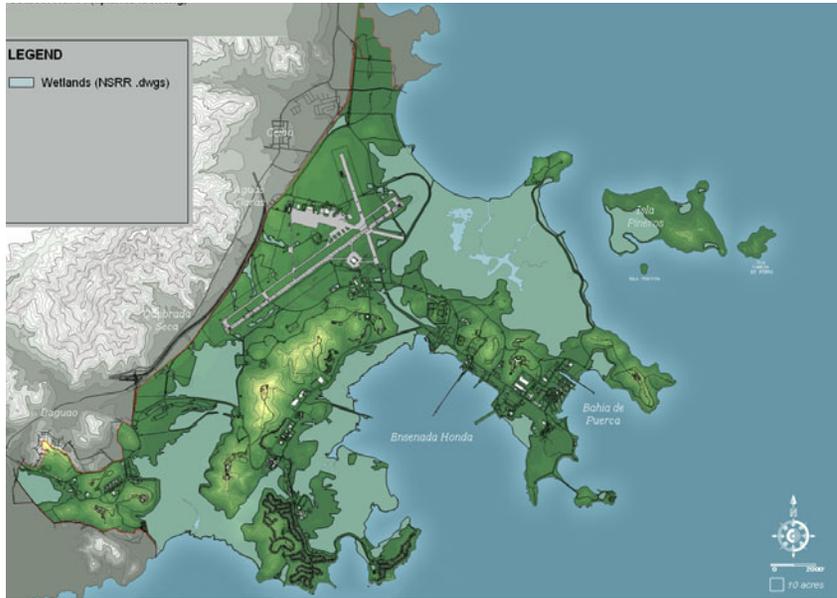

- ❑ Cobana Negra

Wetlands & Mangroves

Figure III.9
Wetlands

Source: NSRR
uplands X-ref drawing

Inclusive of the two smaller islands, approximately 3,882 acres or 45% of the Roosevelt Roads site is identified as wetlands. Within these areas, 10% are categorized as fresh water wetland and 60% are mangroves (2,295 acres).

Of the more than six (6) miles of coastline at Roosevelt Roads, mangroves line the majority of land at the water's edge, defining areas of access and limiting access to the water's edge. Within these designated areas, three types of mangroves are found and each serves a different but vital ecological function. Key in protecting and supporting the low-level organisms in the food chain, each has unique characteristics:

a) **Red Mangroves:** located at the seaward sites, and requiring the highest salinity, these are the first line of defense with respect to beach erosion. Their highly visible and arching prop root systems are typically partially submerged, creating a kind of marine peat, an ideal breeding environment for marine organisms.

b) **Black Mangroves:** to be found closer inland from the shore, typically reached at high tide. Its characteristically high tannin black root system cannot tolerate total submersion.

c) **White Mangroves:** found in upland coastal areas and are rarely inundated with sea water. Their characteristic prop roots are highly visible and the trees are fast growing in fertile soil.

100-Year Floodplain

Figure III.12
100 Year
Floodplain

Source: FEMA
combined zones A, AE,
and VE

According to the FEMA maps for Roosevelt Roads, the 100-year floodline extends beyond the coastal areas at several points far into the northern areas of the site.

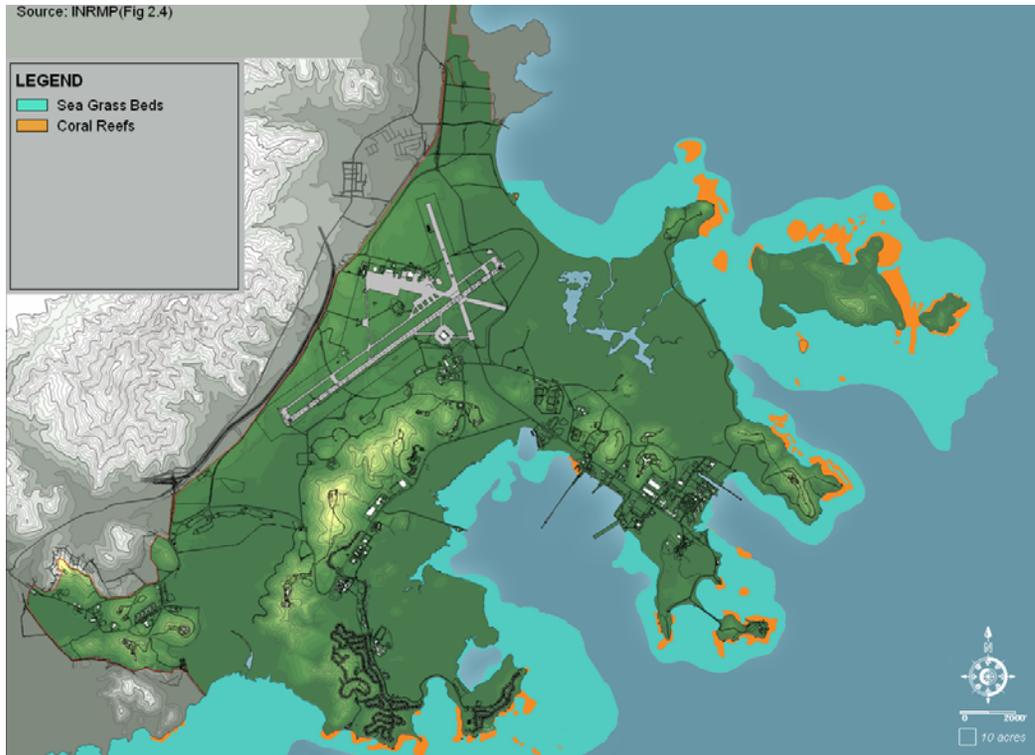

The Floodline takes into account the A, AE and VE FEMA zones.

Whereas these areas are to be avoided in development, mitigation measures may be taken to facilitate development of selected locations within the floodplain if required or economically feasible.

Marine Ecology

Figure III.13
Marine Ecology

Source: FEMA
combined zones A, AE,
and VE

With the exception of bulk-heading on the northern peninsula and small recreational facilities at two beach areas, much of the coastline at Roosevelt Roads is undeveloped. Thus, marine ecology along the coastline at the site has developed with relatively few permanent intrusions.

According to a report entitled *Critical Conservation Areas Roosevelt Roads Naval Station, Ceiba, Puerto Rico* August 2003, issued by the Conservation Trust of Puerto Rico, four endangered species use the marine habitat in and around the site: the Leatherback Turtle, the Green Sea Turtle, the West

Indian Manatee and the Brown Pelican; migratory birds and waterfowl use this area on their migratory route. The Conservation Trust's report asserts the regionally synergistic ecological relationship between the Cabezas de San Juan Nature Reserve, the Vieques Western Conservation Areas, the Humacao and Culebra coastal lagoons and the Roosevelt Roads property.

Among the most important features of the site's marine ecology are the vast seagrass beds that provide critical breeding grounds and habitat for the West Indian manatee population. In addition, in conjunction with mangrove forests, the seagrass beds are extremely important breeding grounds for a number of commercially productive species such as snappers and lobsters.

Figure III.14
West Indian
Manatee

Source:
www.eleas-vieques.com

Roosevelt Roads Reuse Plan: Site, Context, & Market Conditions

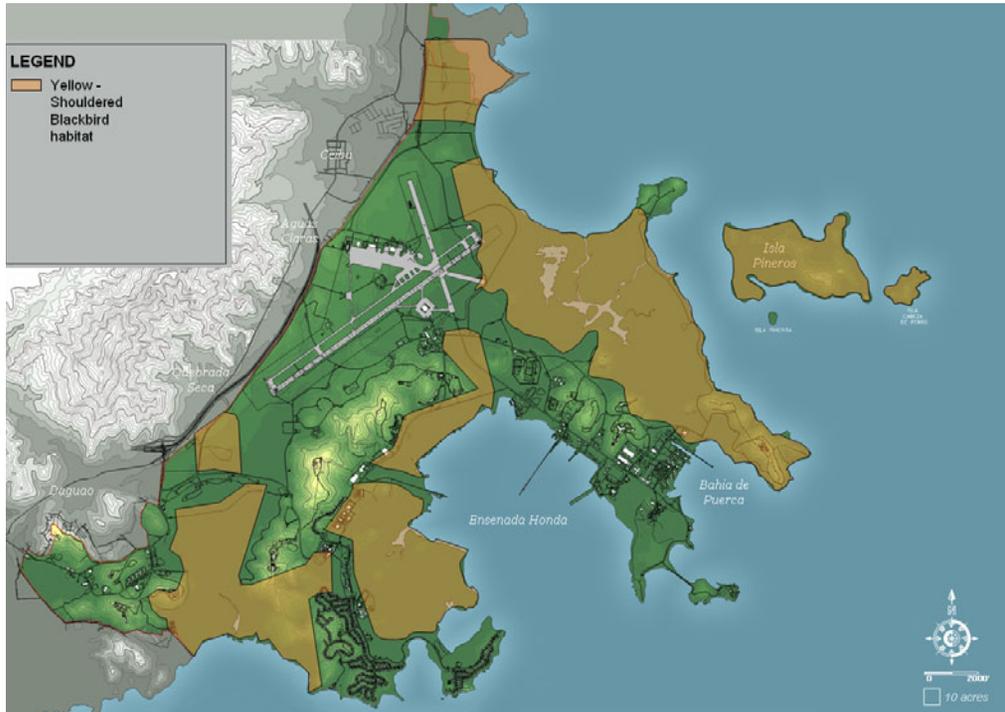

According to mapping provided by prior environmental assessments of Roosevelt Roads, the sea grass area measured from drawing “INRMP Fig 2-4” is 4,000 acres. Conservation Trust suggests this is one of the most significant areas of undisturbed sea grass beds remaining in Puerto Rico, estimating an area of up to 30,000 acres adjacent to the base, subject to verification.

Fringing coral reefs appear in many of the coastal areas of the site and small islands off the site’s northern coast. Considered potentially significant by the Conservation Trust, they are estimated to be of high quality due to lower use pressure of these habitats around the station.

Yellow Shouldered Blackbird

Figure III.15
Yellow Shouldered Blackbird: 1980 Agreement

Source: 1980 Agreement
Between US Navy and
US National Fish &
Wildlife Service

The presence of the Yellow Shouldered Blackbird, (YSBB), a species of “Critical Concern”, is one of the most sensitive environmental issues that the reuse plan will address. Its area of natural habitat is the mangrove forest; the extent to which the birds nest in areas beyond those boundaries will be addressed in the on-going environmental assessment.

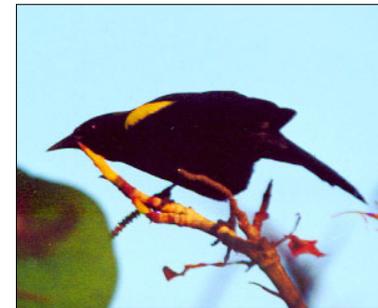

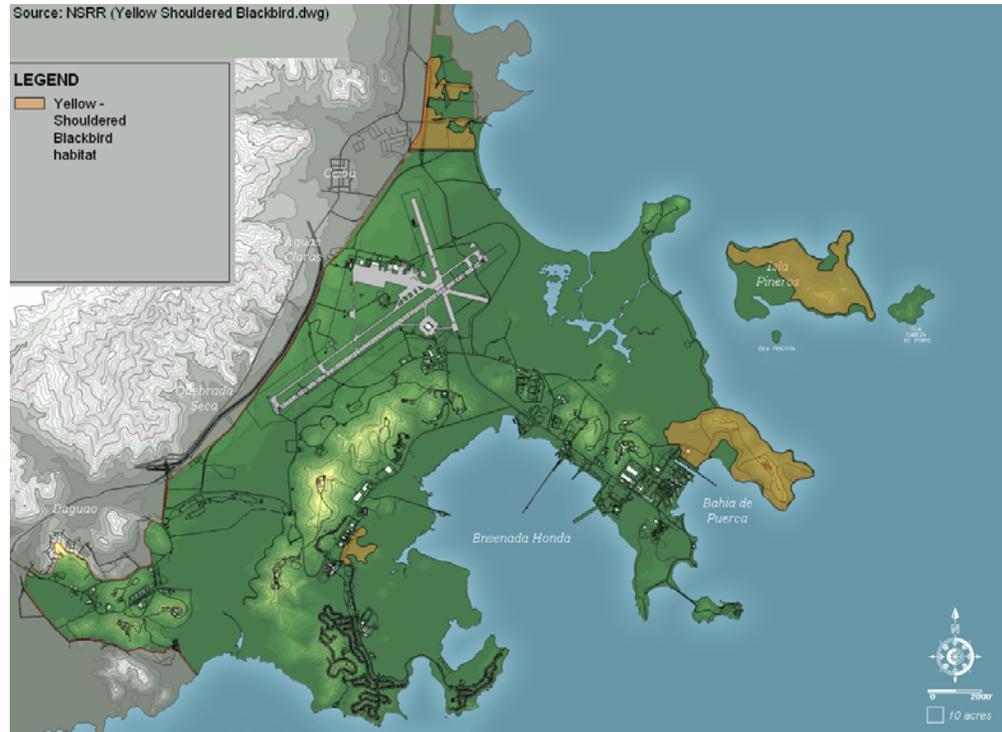

Figure III.16
Yellow Shouldered Blackbird

Source: Peter Ferrera.

Figure III.17
Yellow Shouldered Blackbird Habitat

Source: NSRR (Yellow Shouldered Blackbird.dwg)

A number of mappings show conflicting information with respect to the area of critical habitat:

- 1976: the entire NSRR site was the declared habitat for the birds;
- 1980: an agreement was reached between the Navy and U.S. NFWS (U.S. National Fish & Wildlife Service) that would exempt certain areas within the site from categorization as critical habitat (see Figure III.16).

- 1985: procedures with USNFWS were simplified to allow for project development in “unmarked” areas of the property without express consideration; and a USNFWS review for projects within the “marked” areas with advice to the Navy if the project had no impact. If a project has deemed to have impact on the Yellow Shouldered Blackbird, it would have a formal Section 7 consultation with the USFWS prior to initiation.
- 1996: a study was conducted to better delineate areas that could be used as habitat; per this study, mangrove forests should be considered the most important habitats for the YSBB.
- Present: The latest NSRR drawings indicate that the YSBB habitat is in a very limited area of the site, pending clarification from the the current environmental assessment effort recently initiated by the navy (see Figure III.17).

Marine Turtles

According to the US Fish & Wildlife Service, all six sea turtle species are protected under the endangered species act of 1973. Four species of sea turtles are known to utilize habitats at the Roosevelt Roads property:

- ❑ Loggerhead Sea Turtle, *threatened*
- ❑ Green Sea Turtle, *endangered*
- ❑ Leatherback Sea Turtle, *endangered*
- ❑ Hawksbill Sea Turtle, *threatened*

(Critical Conservation Areas)

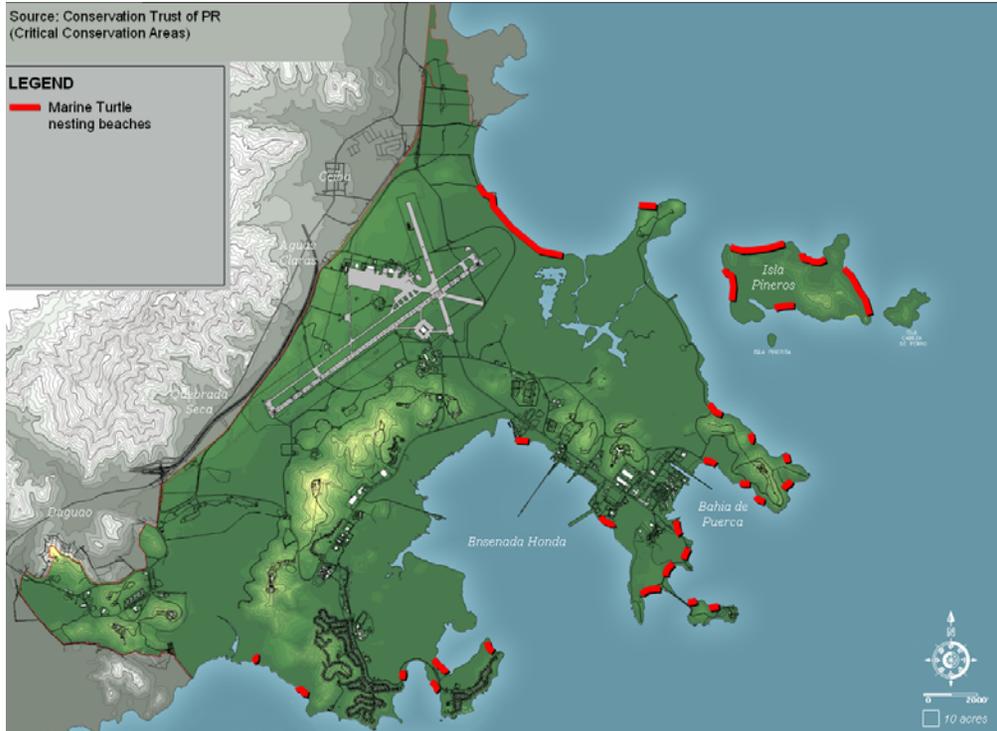

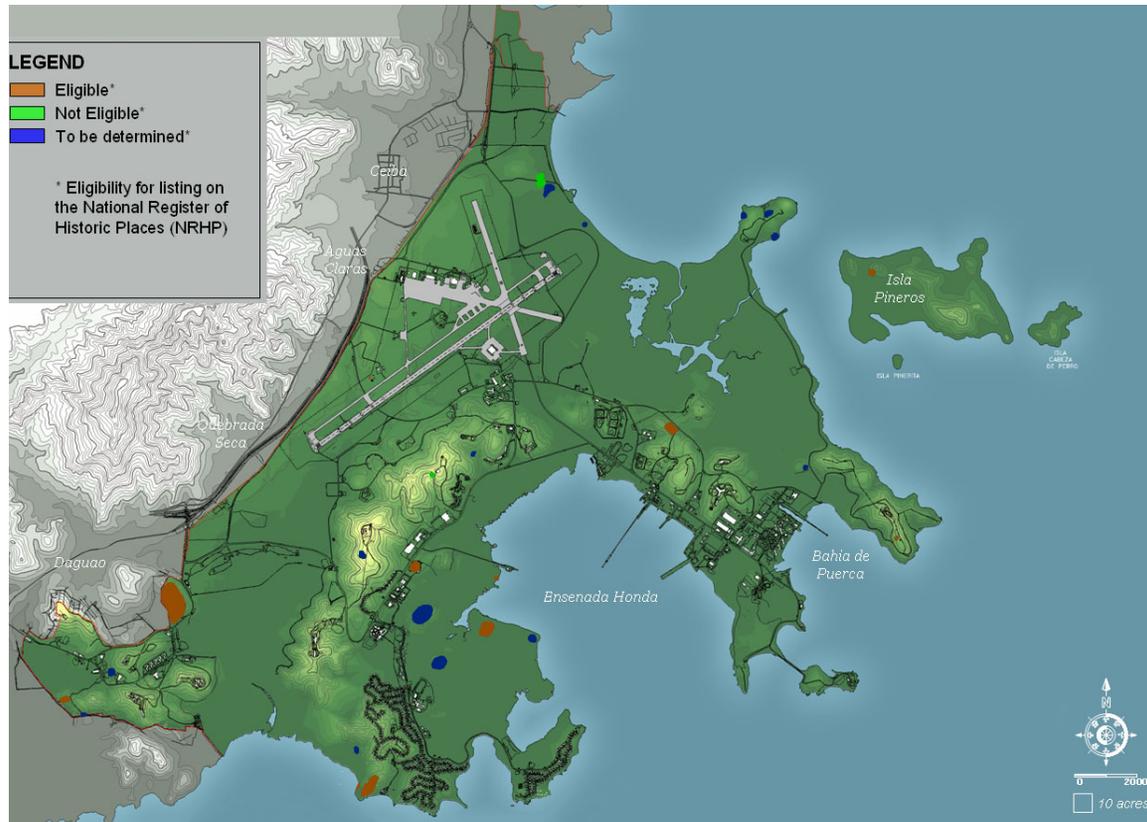

Figure III.18 indicates areas believed potential sea turtle nesting beaches according to the Conservation Trust of Puerto Rico; these will be subject to confirmation in the coming months. Designated nesting areas in St. Croix, Isla de Mona and Culebra, established by the Fish and Wildlife Service, are mapped on their

Archaeological Sites

Figure III.20
Archaeological Sites

source: ECP (Figure 2-7, Arch.Sites.dwg)

In accordance with Section 110 of the National Historical Preservation Act, the Navy performed a survey to identify cultural sites at Roosevelt Roads. Findings include evidence of settlement during the Archaic and Ceramic Ages, and the period occurring during the Spanish Colonial occupation period up to 20th Century historic period. These were evidenced among the noted findings:

- small tenant-farmer agricultural sites dating prior to development of the Naval base, which is entirely consistent with local development patterns;

- a 19th century Spanish Colonial domestic site on the southern fringe of Ensenada Honda
- a 19th century sugar complex in higher elevation Bundy area

Of the twenty-nine sites explored, four (4) are Spanish Colonial, seventeen (17) are Pre-Columbian, four (4) are multi-component sites from both periods, and four (4) are rock art sites. In summary, two (2) sites were determined eligible for NRHP listing, another twenty (20) were determined to be potentially eligible for listing, three (3) determined not to be eligible; and four (4) were not evaluated.

A.IV Potential Development Areas

Parallel with the study of physical and natural aspects of the site, the consulting team identified areas of the Roosevelt Roads that could potentially support development while observing constraints that its coastal ecology presents.

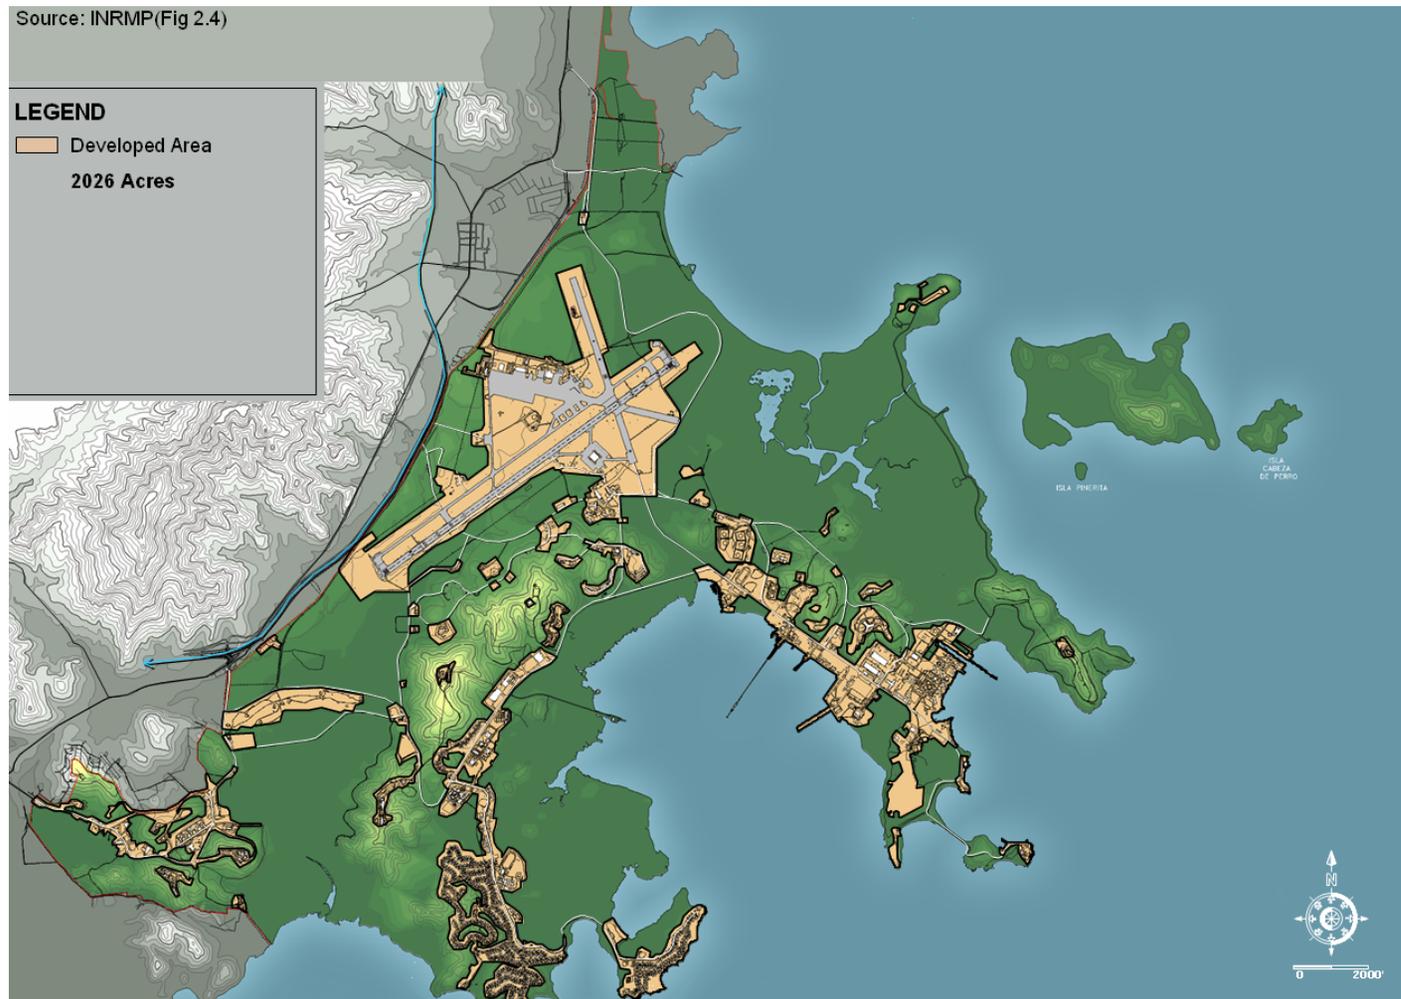

The consulting team investigated existing land use and existing infrastructure. They sought to identify and then quantify potential developable areas through a series of key “lenses” that non-subsidized development would typically address relative to valuation.

Existing Land Uses: Developed Area

Roosevelt Roads today consists of non-contiguous or “fragmented” concentrations of existing development. Existing land use on the base is clearly related to topography, and building typology, partially explaining the predominance of small-scale rather than large-scale structures. The total existing developed area of the base approaches 2,026 acres, exclusive of most of the infrastructure.

Figure IV.1
Developed Area

Source: INRMP Report
(fig. 2.4)

Roosevelt Roads Reuse Plan: Site, Context, & Market Conditions

According to land configuration, existing developed areas within these precincts are “multi-use” versus “mixed-use”: adjacent structures house relatively similar or related uses, rather than a broad mix of uses within a given area. Uses therefore tend to be clustered together.

- **Airfield:** The primary runway (7-25) at the airfield is 11,200 linear feet long, exceeding the length of the runway at San Juan International airport. A secondary runway (18) is 6,000 feet, including its southern extension south of the main runway. There are also two helicopter land-

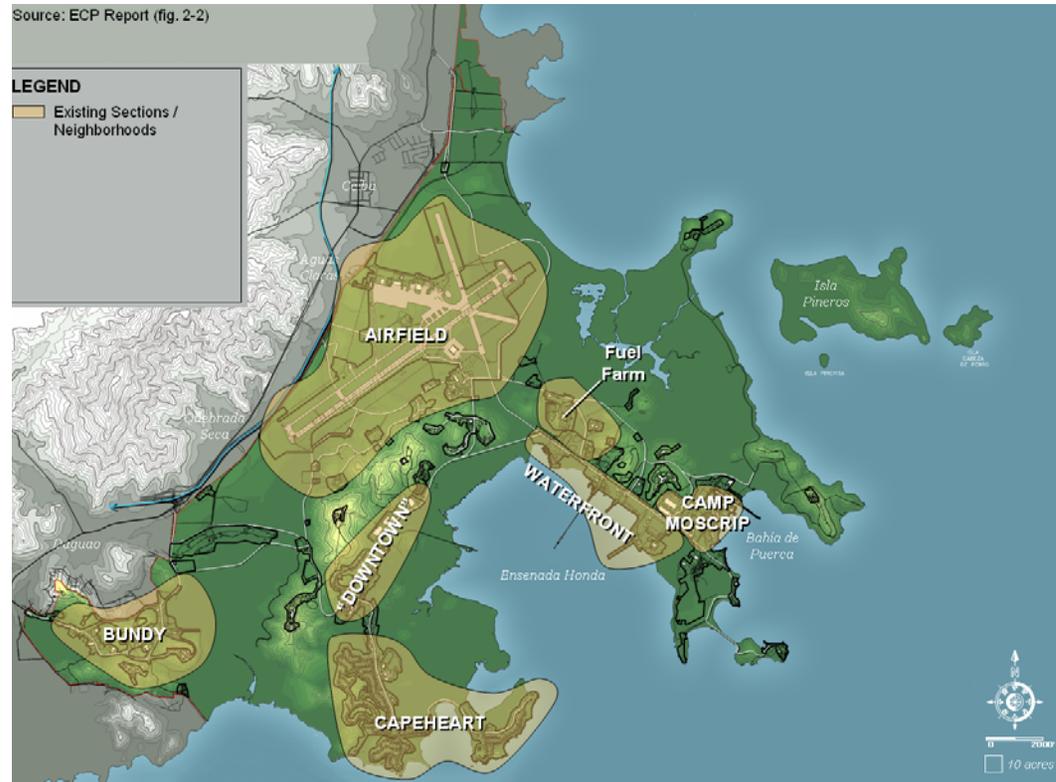

Figure IV.2
Developed Area

Source: ECP Report (fig. 2-2)

ing pads at the airport. Together with a series of buildings north and south of the airfield that include hangars, repair shops, an operations building, and those used specifically for military purposes (weapons buildings, survival equipment workshops, etc) and storage facilities, the airport facilities are a major asset for the site and the entire region. A small “campus” of classroom and office buildings, with an adjacent gymnasium and other support facilities, are clustered near the vehicular entry to the airfield.

Figure IV.3
Airfield Terminal

Source: CRP

Roosevelt Roads Reuse Plan: Site, Context, & Market Conditions

- **Bundy:** Accessed directly through Gate 2, the controlled southern access gate to the property, as well as with a small outlet near Naguabo, the Bundy area is the western-most grouping of facilities at the site. Its pre-dominant land uses include multiple clusters of multi-family housing and supporting facilities (fitness center, small theater, library, outdoor recreational fields). There are also a number of small storage and office buildings.
- **“Downtown”:** Between the eastern ridge of the Delicias Hills and the mangroves along the center of the harbor, the “Downtown” area of the base contains many of the commercial and institutional use buildings: the Commissary, the Navy Exchange (PX), an ambulatory medical facility with doctor and dental offices, the chapel, the day care center, the bowling alley, a fast food restaurant. There is also the base’s “hotel”, the Navy Lodge, a number of multi-family structures to the north that house new and recently renovated quarters for enlisted personnel. To the east, one single pier at the center of the harbor affords a sweeping view over Ensenada Harbor and the Caribbean beyond.
- **Capehart:** Southeast of the Downtown, the Capehart area is the primary residential district at Roosevelt Roads. The northern portion of this area consists of family-sized garden apartment buildings, a large elementary school, housing office building, and metal storage buildings. The central section of Capehart consists primarily of smaller one (1,800’–1,900’ SF) and two family houses, some with water views, many recently renovated. A large middle/high school with air-conditioned gymnasium and dining facilities is sited conveniently to this residential area. The largest houses, many sited along the elevated waterfront promontory and located at the “boot” of the southern peninsula, range in size from 2,100 to 3,200 SF, housing ranking officers and their families.

Figure IV.4
Bundy

Source:CRP

Figure IV.5
Capehart

Source:CRP

Roosevelt Roads Reuse Plan: Site, Context, & Market Conditions

- **Waterfront:** A 2,600' long fuel mooring pier dominates the waterfront, jutting far enough into the harbor to allow large tankers to pump out their fuel loads to be stored in the "fuel tank farm" to the north. Other facilities include many of the water-related facilities on the base: a 1,200' long cargo pier, a small marina, the port operations buildings; various hauling facilities, and extensive bulkheading characterize this portion of the site. Adjacent to the harbor front, across the peninsula's main access road, the commanding officer's headquarters, the public works building, and a significant refrigerated storage facility are clustered together, their siting carved out of the surrounding ridge. Overlooking the waterfront, at the upper portion of the surrounding hills, the base hospital, a staff residential facility and a small restaurant have outstanding views of the harbor as well as the islands to the north.
- **Camp Moscrip:** A cluster of facilities is located at the southeastern end of the northern peninsula. It includes numerous two-story military quarters buildings and adjacent support facilities, the dry-dock/pier, new, never-occupied Navy Seal administrative offices and new barracks. It also includes the large-scale former dry-dock facility (now-flooded), the Army Reserve facilities and equipment/truck parking lot.

Infrastructure Supports Existing Land Use

Infrastructure at the base supports the existing land uses. Infrastructure is purely functional, and has not been designed to have an aesthetic quality. Please refer to Appendix B of this report for a thorough overview of all key aspects of the base's infrastructure including roads, water, sanitary systems, electricity, and fiber optics and communications. The two small

islands to the north have no infrastructure improvements. As long as the systems are maintained, the site's existing infrastructure allows for accelerated "early phase" activity at the base without major investment in infrastructure to the extent that it occurs within the confines of existing developed areas. A summary of Land Uses and their locations are indicated on the drawing below.

Figure IV.9
Land Use

Roosevelt Roads Reuse Plan: Site, Context, & Market Conditions

Figure IV.10
Roads

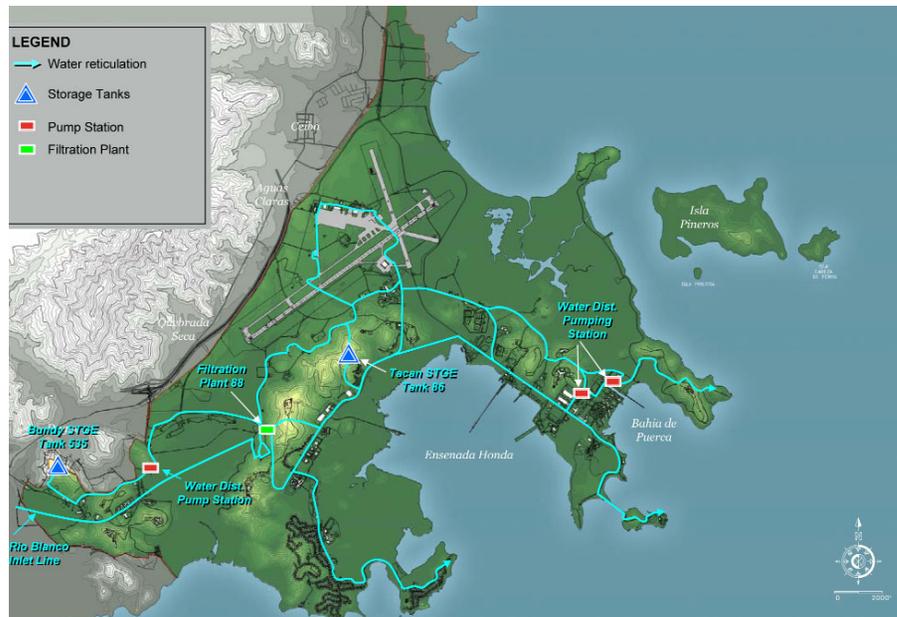

Source: NSRR

Roads: The two main gates to the base, one to the north of Ceiba, and another south of town are controlled access points. The northern gate can easily service the airfield and could be isolated if required. There is a central road through each of the two peninsulas, lined by the access road through the “Downtown” portion of the site. To the west, the Bundy access roads could potentially outlet toward Naguabo.

Figure IV.11
Water Distribution System for Roosevelt Roads

Baker CAD

Airport Noise: The noise zone created at takeoff and landing is indicated in the above drawing. The configuration of the hills surrounding the airfield helps to contain the noise from the "Downtown" area. Bundy is the area most extensively impacted by the airfield noise.

Development Constraints

The consulting team’s investigation of natural, physical characteristics together with man-made impacts to the site yield a series of analytic drawings culminating in “layers” of development constraints. These superimposed constraints reveal the resulting developable land.

Gradient Constraints

The first constraint relates to the site’s topography. The consultants mapped the site’s gradients in 5% increments from 0% to 25% in order to locate the most easily developable areas of the site. Figures IV.16–IV.20 indicate the sequence and outcome of this investigation.

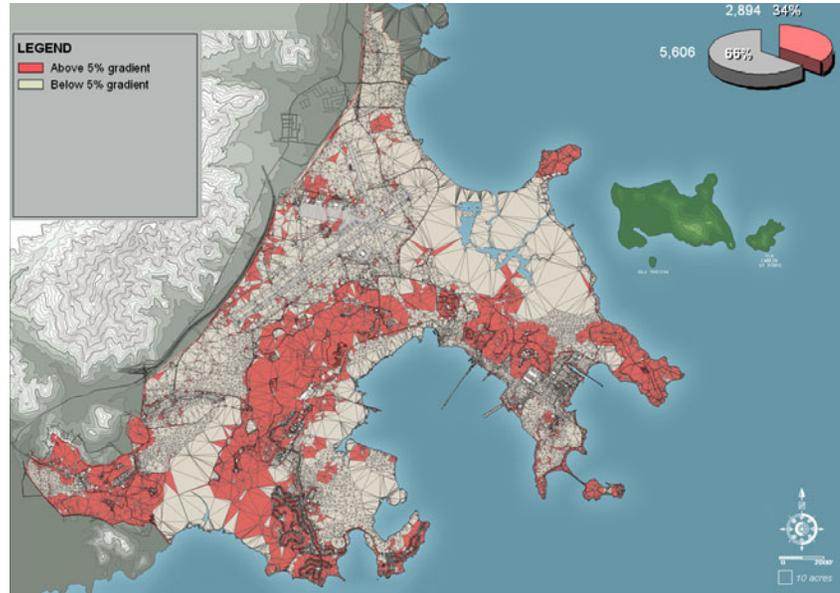

Figure IV.16
5% Gradient

Source: CRP

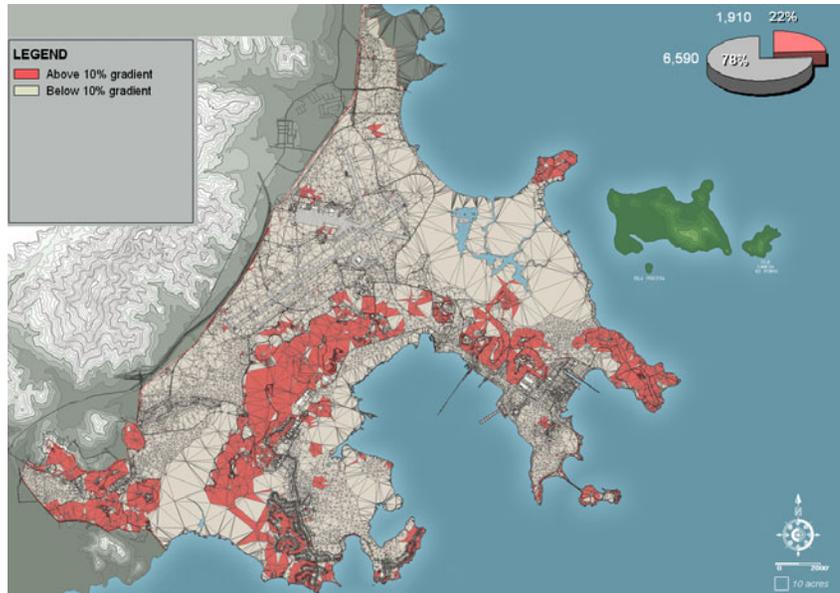

Figure IV.17
10% Gradient

Source: CRP

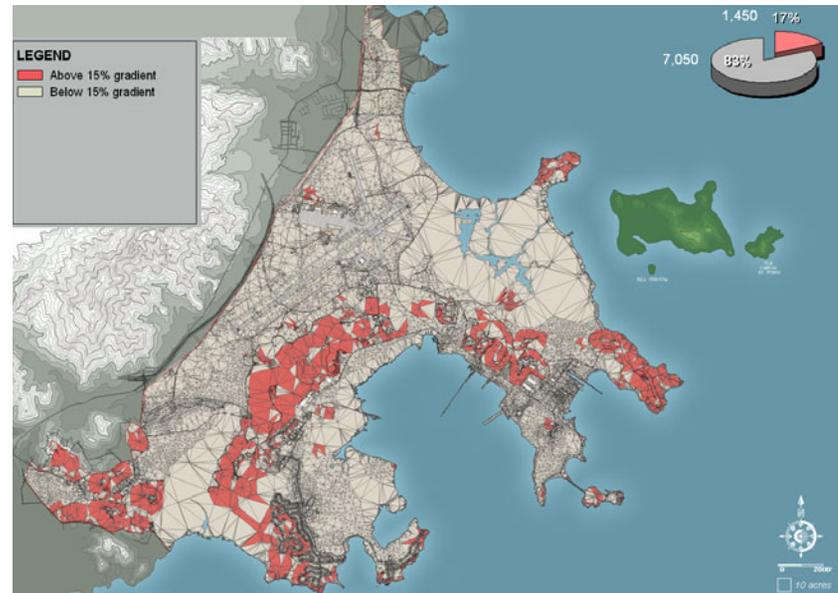

Figure IV.18
15% Gradient

Source: CRP

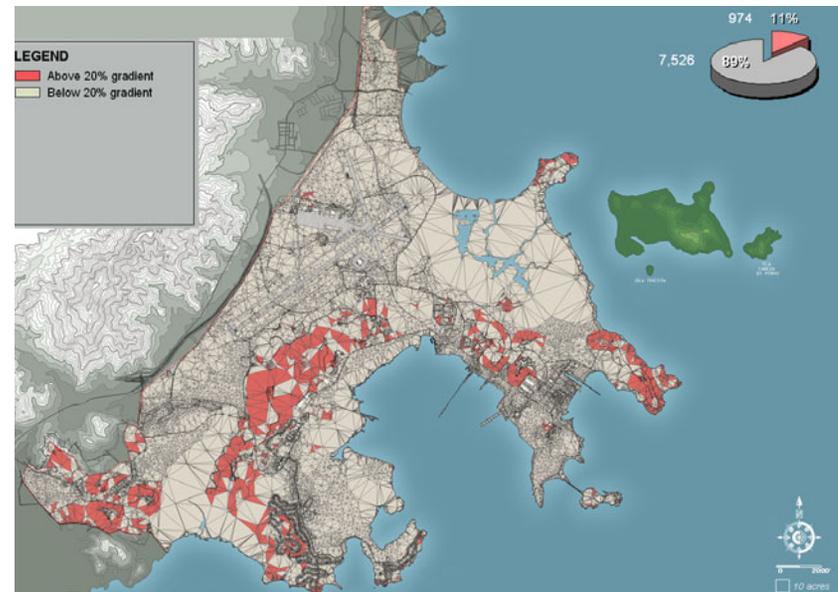

Figure IV.19
20% Gradient

Source: CRP

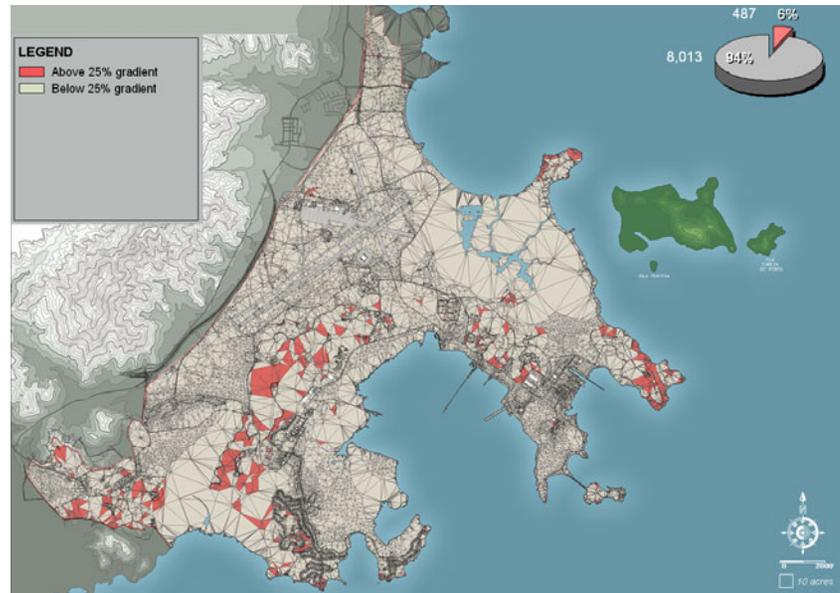

Figure IV.20
25% Gradient

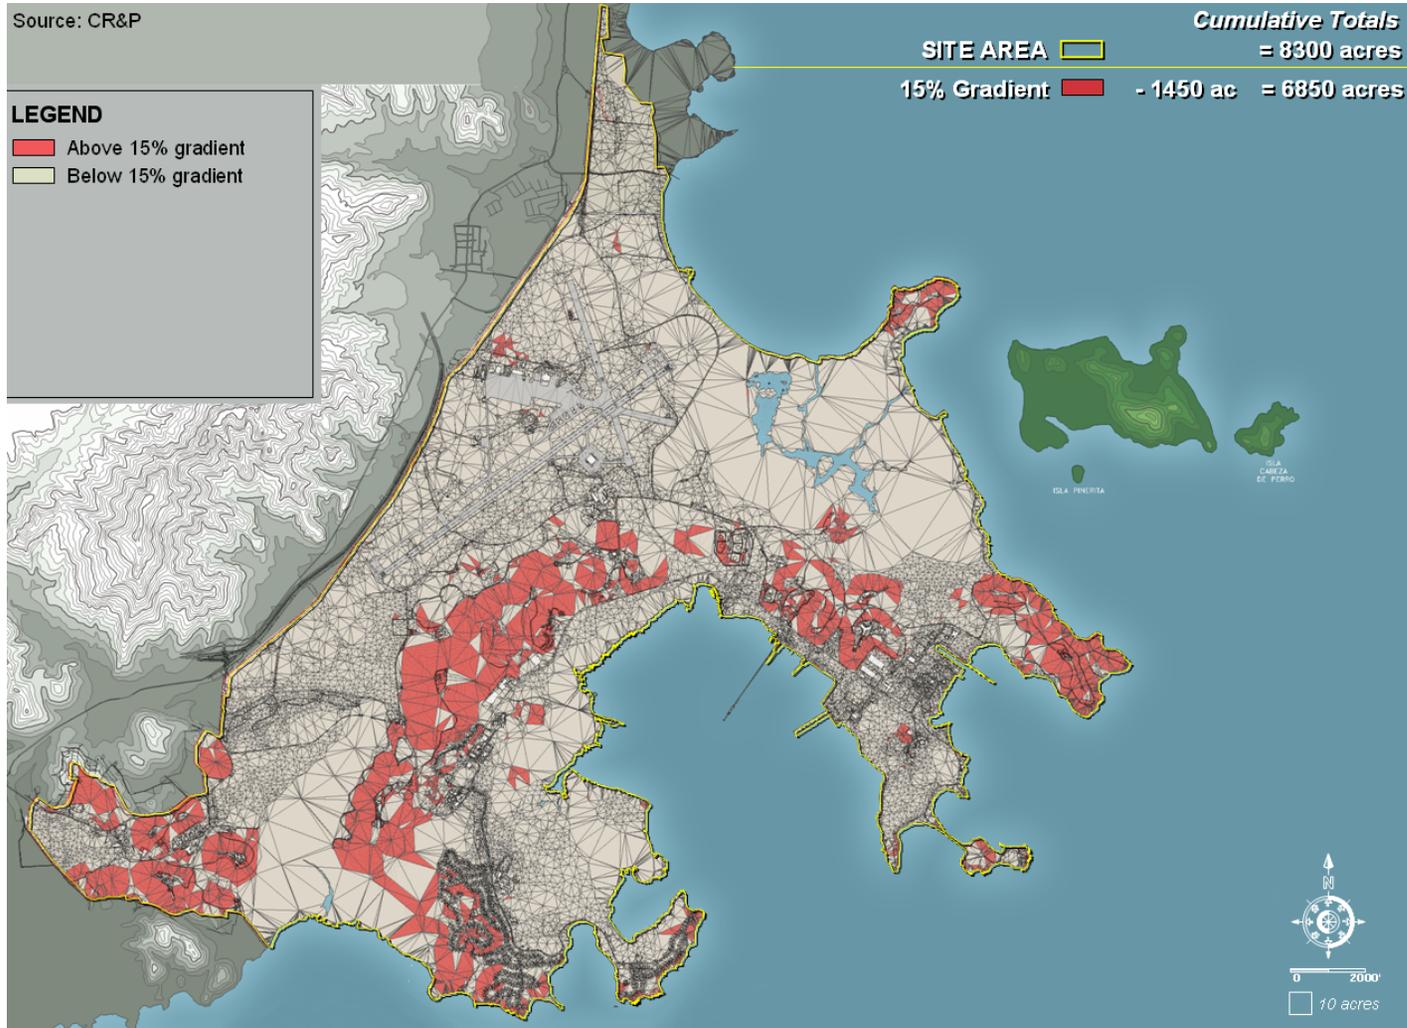

Source: CRP

Summary of Gradient Constraints

The site's varied topography and steep slopes impact where development can occur without significant cost penalty. The site's gradients are depicted in the series of accompanying drawings, and quantified at 5% increments above and below 5%, 10%, 15%, 20% and 25% slopes. Typically, a gradient above 15% is determined too steep to build on without additional cost premium for earthwork, foundations and sitework and is therefore a development constraint.

Figure IV.21
 In this analysis, site area is understood in terms of resulting land area above and below this threshold. Approximately 83% of the site area, or 6,850 acres is 15% gradient or below; 1,450 acres are above 15% gradient. Total site area less 15% gradient leaves 6,850 remaining acres.

Source: Project Team

Water Access: Coastline

Of the 21 actual mile length of the Roosevelt Roads coastline, approximately 9.1 miles of waterfront is inaccessible due to wetlands, and another 2.9 miles of waterfront is inaccessible due to the site's steep topography. Just under half of the coastline, 9.3 miles is accessible.

and Gradient

Wetlands with Gradients

Taken together, the site’s extensive wetlands including the mangrove forests and wetland meadows present a development constraint, limiting water access and restricting sites for new development. The accompanying drawing

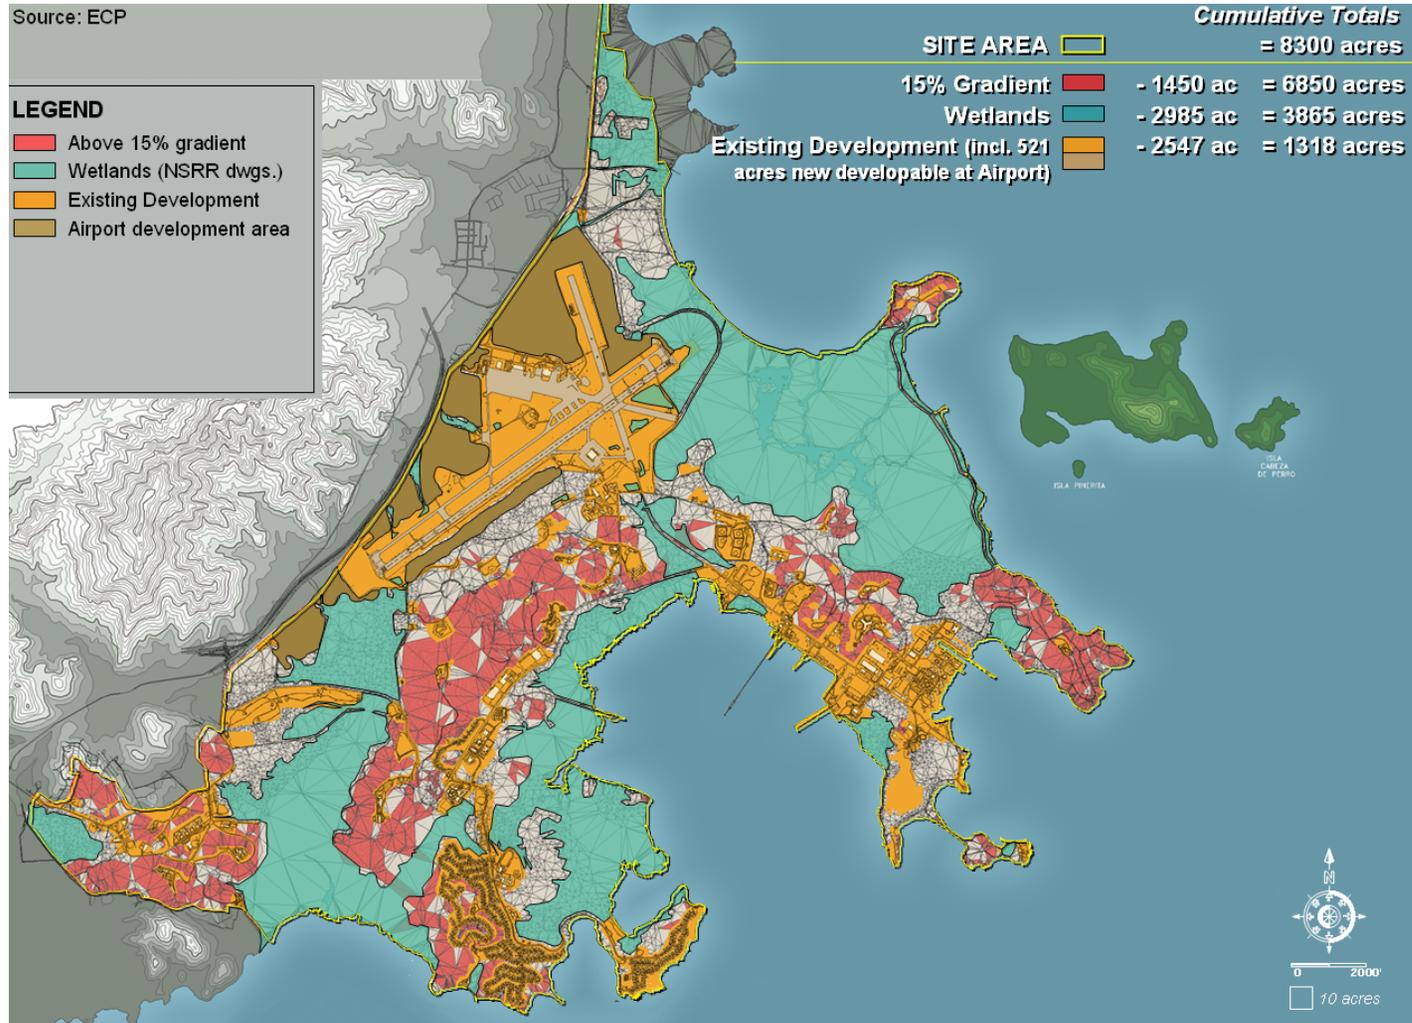

locates 2,985 acres of combined wetlands (inclusive of mangroves per the Navy ECP report) on the site superimposed on the 1,450 acre area with above 15% gradient. Together these yield remaining developable area of 3,865 acres.

Wetlands, Gradients and Existing Development

The existing development at Roosevelt Roads encompasses 2,026 acres. inclusive of some portion of roads and infrastructure. When this acreage is combined with 521 acres of additional airport property potentially developable for airport-related or public benefit purposes, this totals 2,547 acres. There are 1,318 acres available for development, exclusive of wetlands, gradient constraints, existing development, and the potential airport related development area (521 acres).

Figure IV.24
Wetlands,
Gradient and
Existing
Development

Source: NSRR
(uplands.dwg)-
North-of-gate Wetland

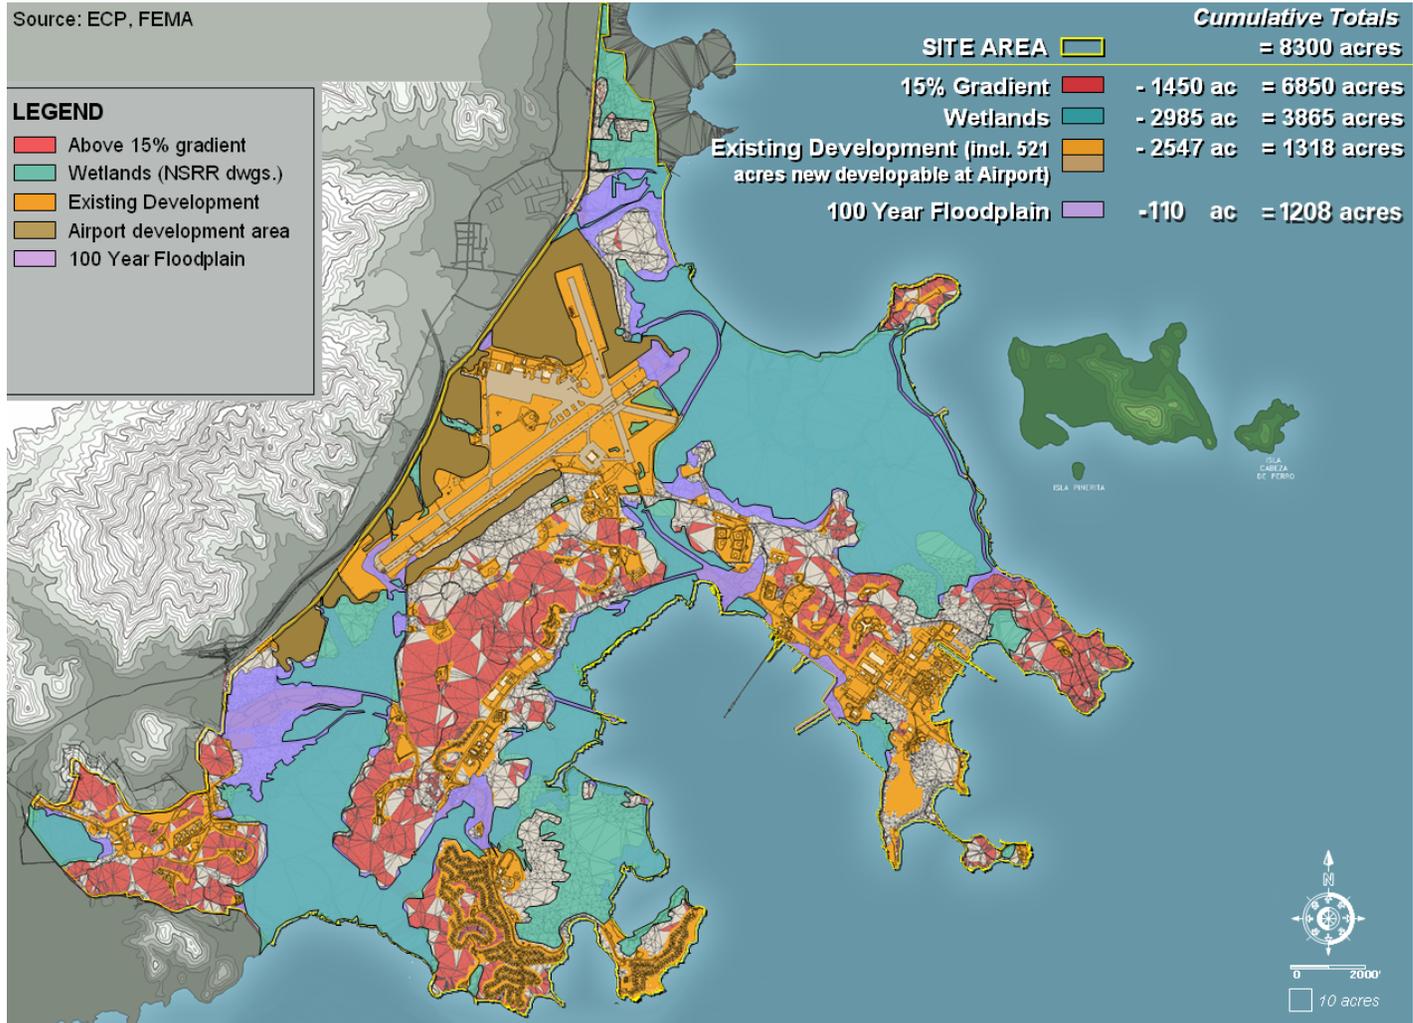

Wetlands, Gradients, Existing Development and Floodplain

The 100-year Floodplain limits potential development even further. When floodplain acreage is excluded, the resulting acreage available for new development is 1208 acres (exclusive of the 521 acres of development area at the airport).

Summary of Developable Land

Combined area available for development and re-development = 3,755 acres, including the 521 acres of new airport development.

Figure IV.26

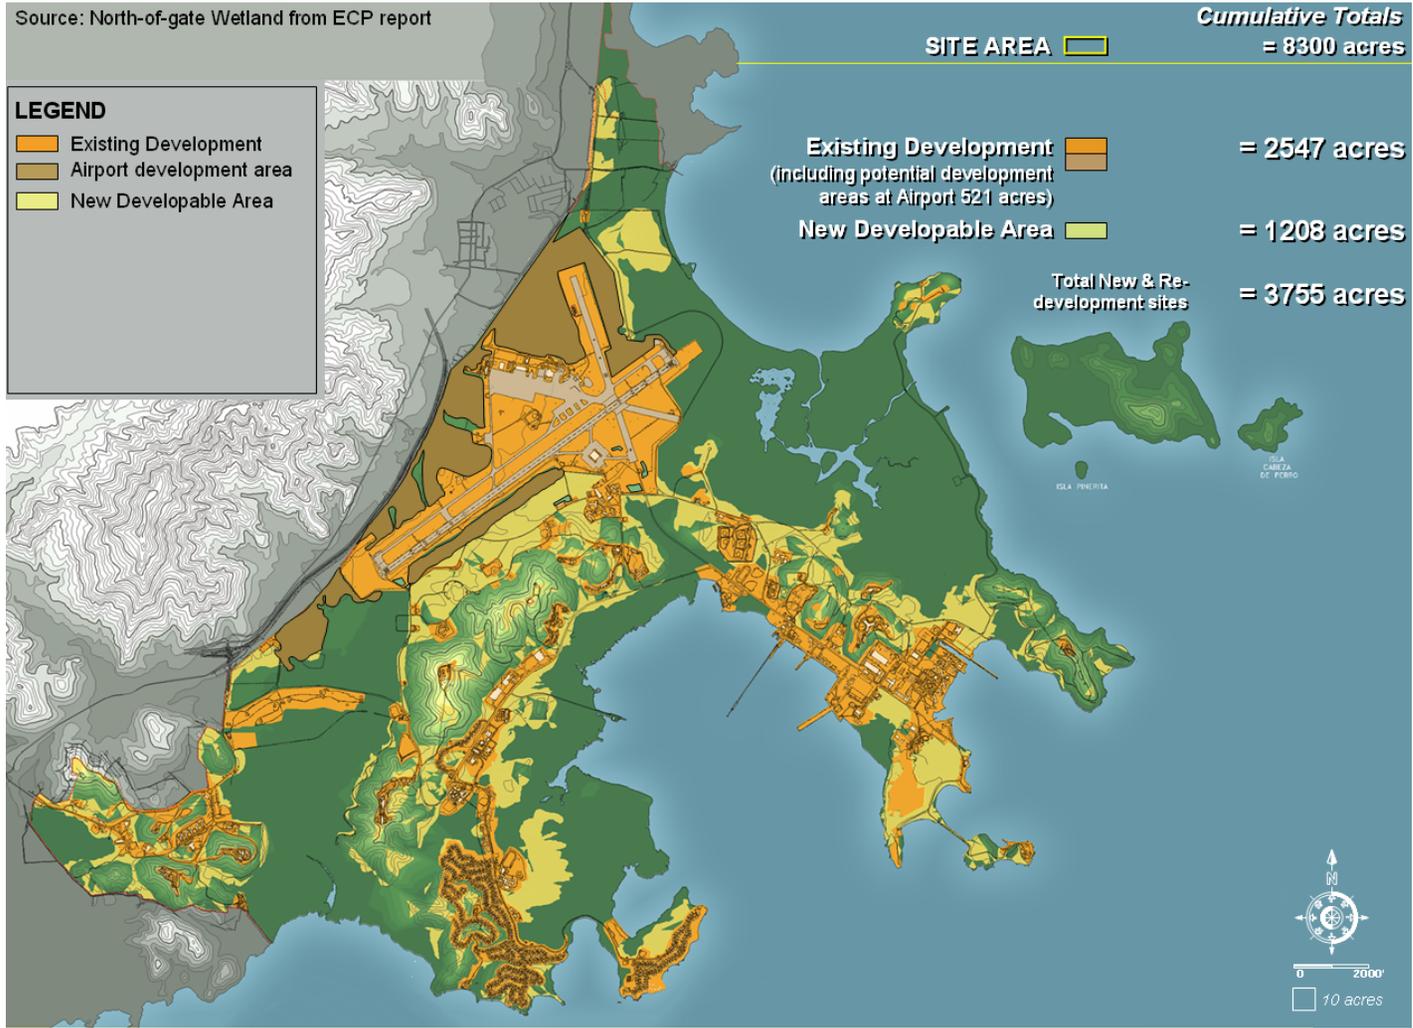

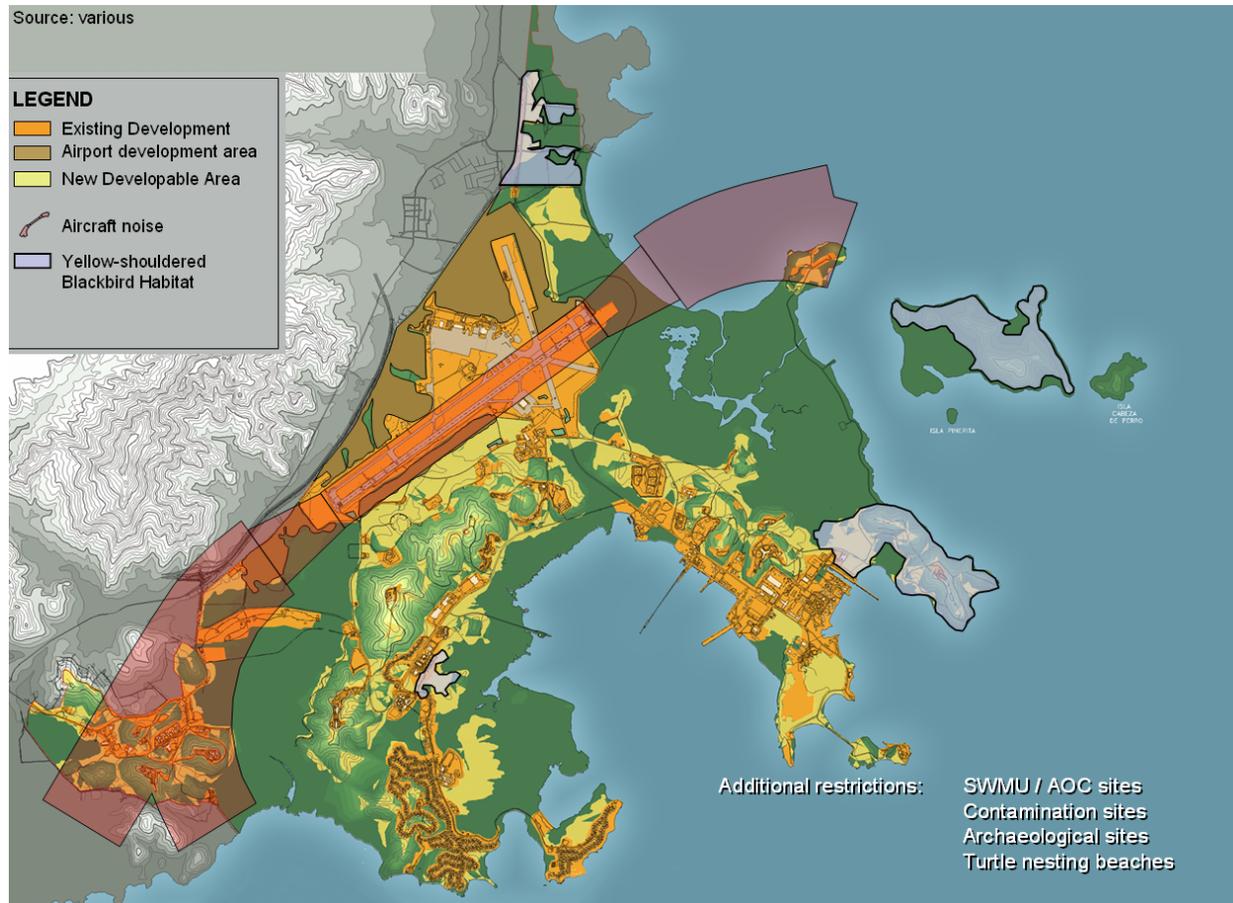

Figure IV.27
Additional
Constraints

Source: North-of-gate
Wetland from ECP Report

Additional Development Constraints

There are several additional potential development constraints that are awaiting further clarification with respect to precise location, permanence and adjacency to new development:

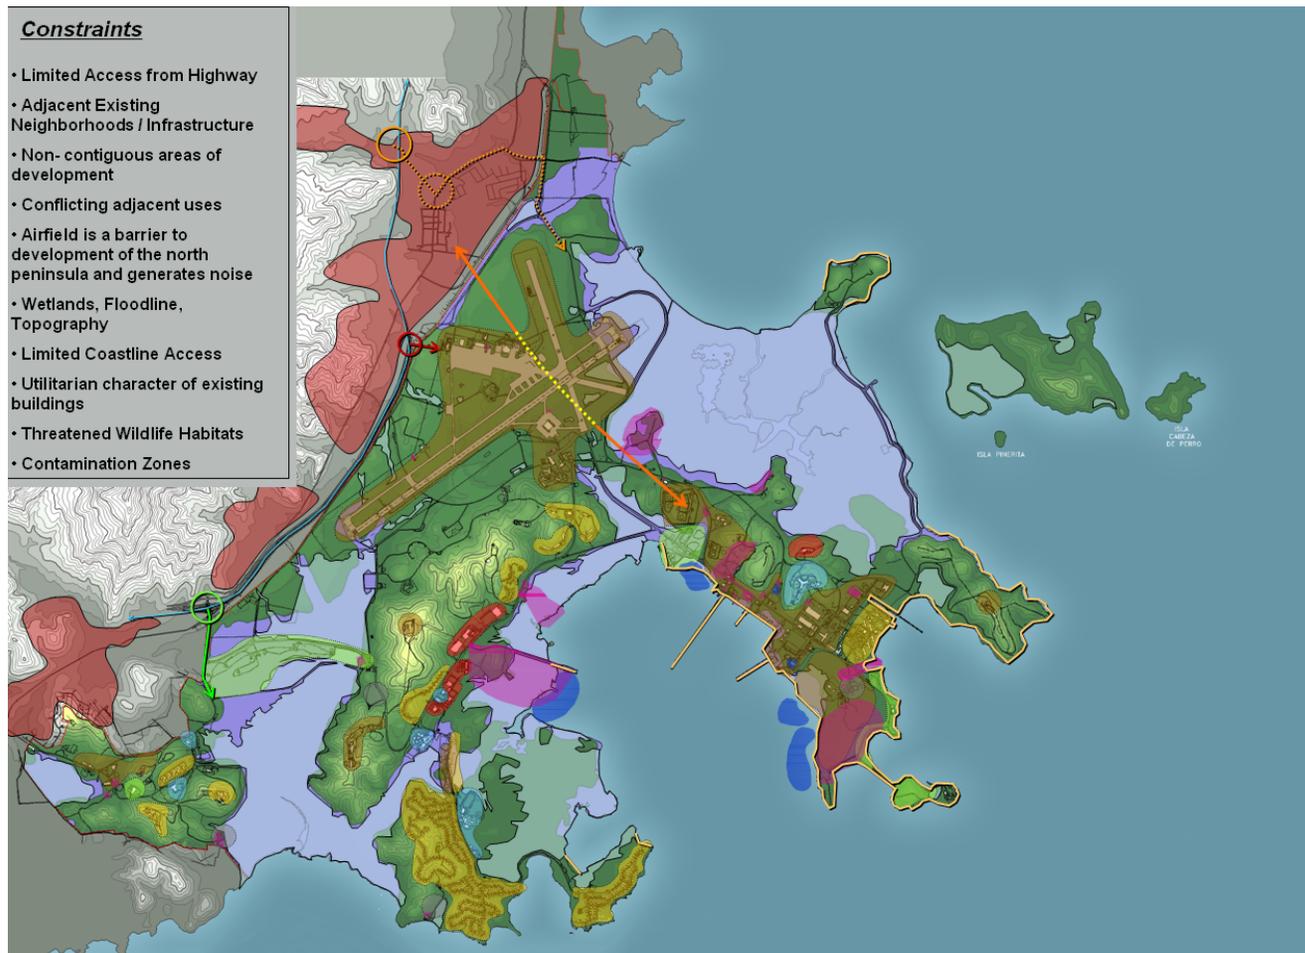

- ❑ Solid Waste Management Unit (SWMU) Sites
- ❑ Area of Concern (AOC) Sites
- ❑ Contamination Sites
- ❑ Archaeological Sites
- ❑ Yellow-Shouldered Blackbird Habitat
- ❑ Turtle Nesting Beaches
- ❑ Aircraft noise

Section A.V Opportunities & Constraints

The following is a summary of the physical constraints facing any development effort at Roosevelt Roads.

Figure V.1
Summary of
Constraints

Source:
Consulting Team

Summary of Constraints

- **Limited Access from Highway:**

At first glance, Roosevelt Roads appears to be well-served by the PR-53 Freeway which runs tangential to a fairly long section of its western boundary. However, the Bundy section in the south is well served by the Bennington Road offramp while the northern gate is served only via a circuitous route through Ceiba. No direct access is currently available from the freeway in the airport vicinity.

- **Adjacent Existing Neighborhoods / Infrastructure:**

The adjacent neighborhoods of Ceiba, Aguas Claras, Quebrada Seca and Daguao offer little in the way of commercial or infrastructural support.

- **Non- contiguous areas of development:**

Existing development on the station is characterized by a fragmented arrangement of developed areas tenuously connected by a network of low capacity roads. Future development may concentrate on "stitching together" the disparate parts in order to create a more cohesive built environment.

- **Conflicting adjacent uses:**

In cases where pockets of development do meet each other, adjacent uses occasionally conflict and do not allow for a synergistic relationship between them.

- **Airfield is a barrier to development of the north peninsula:**

Almost half the length of Roosevelt Roads is rendered inaccessible by the sheer length of the airfield runway. Access to the north peninsula in particular is compromised due to the relatively short stretch of land between the runway and the ocean which is non-developable mangrove forest. The airfield also generates substantial noise, particularly in the Bundy area.

- **Wetlands, Floodline, Topography:**

The combination of designated wetlands, mangrove forests, and low, flat topography in the valleys as well as the potential flood inundation of almost half the site results in the scarce availability of developable ground. The haphazard arrangement of existing development reflects this.

- **Limited Coastline Access**

As a result of steep topography at the peninsula extremities and low-lying wetlands between them, just under half the coastline of Roosevelt Roads offers water accessibility.

- **Utilitarian character of existing buildings**

Although many of the existing buildings at the station are in good condition, few could be considered to exhibit any architectural character upon which to develop a vernacular.

- **Threatened Wildlife Habitats**

The extent and location of natural habitats for several threatened and endangered species of flora and fauna need to be considered before any development of Roosevelt Roads can be considered.

- **Contamination Zones**

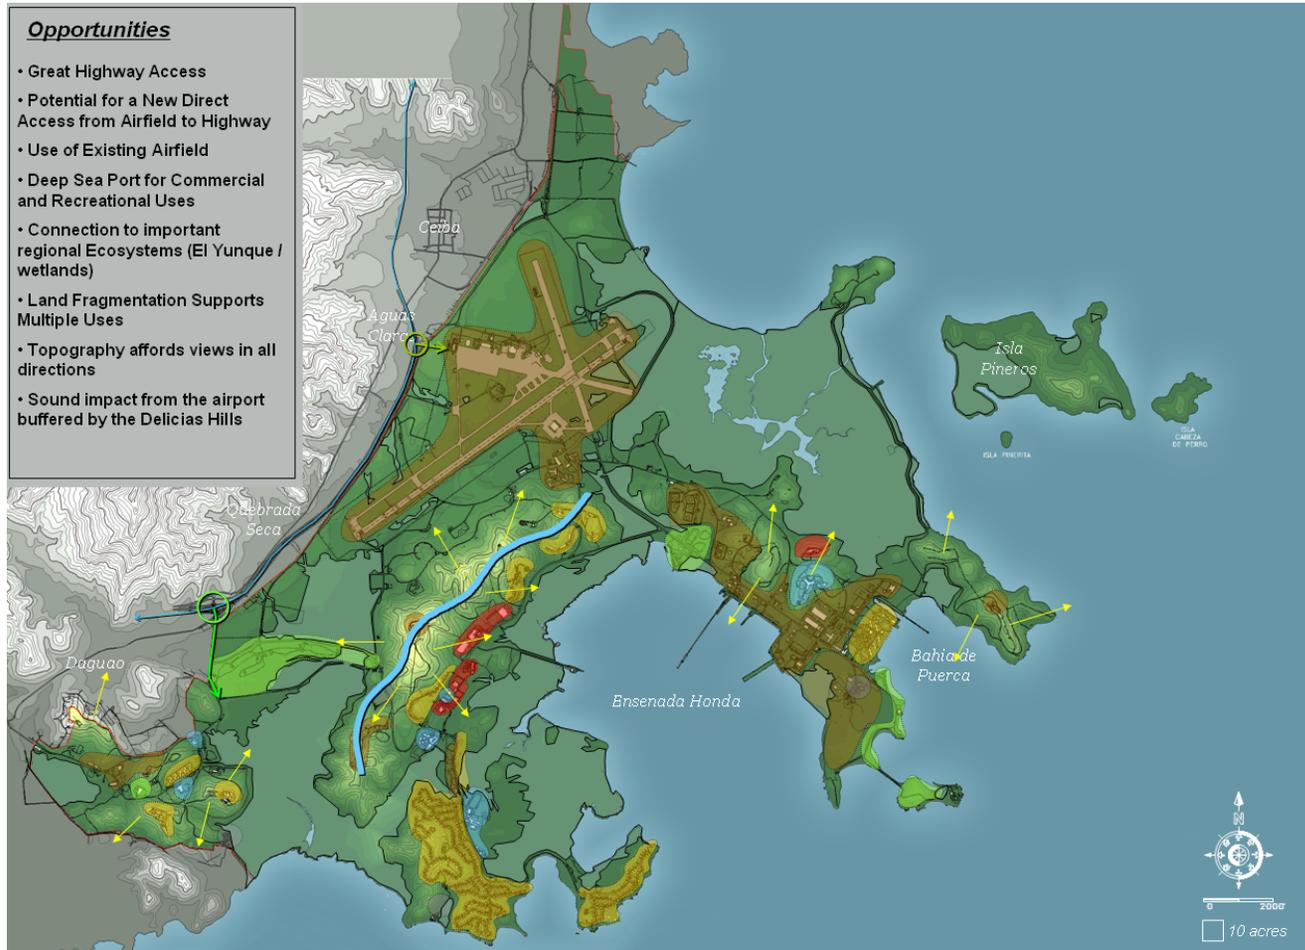

The clean-up or mitigation of identified areas of concern (AOCs) and solid waste management units (SWMUs) would be an essential prerequisite to development.

Roosevelt Roads Reuse Plan: Site, Context, & Market Conditions

The site affords several opportunities which will be explored further as part of the design options in the next phase of work.

Figure V.2
Summary of
Opportunities

Source:
Consulting Team

Summary of Opportunities

•Direct Highway Access at Southern Gate

Particularly good highway access is available from the south from the Bennington Road offramp to Bundy. This route also feeds into Langley Drive providing access to the "Downtown" and north peninsula areas.

•Potential for a New Direct Access to Airfield from Highway:

The introduction of a third highway interchange in the airport vicinity would greatly improve airport accessibility.

•Use of Existing Airfield

The airfield is well served by its support facilities and would be a tremendous asset to certain future development scenarios.

•Deep Sea Port for Commercial and Recreational Uses

The current dredge depth of 40' in Ensenada Honda and 30' in Bahia de Puerca widens the range of marine craft docking possibilities.

•Connection to important regional Ecosystems (El Yunque/wetlands)

The linkage of regional marine ecosystems to that of the El Yunque rainforest is a rare asset. This adjacency provides a unique opportunity to forge a network of seamless preserves and open spaces

•Land Fragmentation Supports Multiple Uses

The physical arrangement of land sections (peninsulas and valleys) allow for the potential separate development of unrelated land uses if deemed desirable by further market analysis.

•Topography affords views in all directions

Views in all directions are afforded by the steep topography of the Delicias Hills and other promontories around the site.

•Sound impact from the airport is buffered by the Delicias Hills

Ensanada Honda is protected from intrusive airport noise by the ribbon of hills surrounding it.

I. Introduction

Introduction & Purpose

CB Richard Ellis Consulting (“CBRE Consulting” was retained by the Department of Economic Development and Commerce of the Commonwealth of Puerto Rico as the lead firm for the preparation of a redevelopment plan for the reuse and redevelopment of the 8,600-acre U.S. Naval Station Roosevelt Roads (“Roosevelt Roads”), which ceased operations on March 31, 2004. As part of this broader effort, CBRE Consulting was tasked with conducting an economic and real estate market overview in order to assess the market opportunities and constraints likely to be associated with Roosevelt Roads. The anticipated outcome of this overview is the identification of the types of land uses that are likely to be supported from a market perspective at Roosevelt Roads. These uses will then become an input to future conceptual planning for the site.

Methodology

In conducting this review, CBRE Consulting completed the following tasks:

1. Conducted multiple site visits beginning in fall of 2003.
2. Researched economic and demographic data on Puerto Rico and the region surrounding Roosevelt Roads prepared by local associations and other conventional sources;
3. Interviewed representatives of universities, industry associations, government agencies, and other interested parties to ascertain level of potential support for development at Roosevelt Roads.
4. Contacted local real estate-related professionals in Puerto Rico in order to gather data on the various real estate markets; and
5. Researched and evaluated available market data for these land uses.

Summary of Major Findings

- According to the 2000 Census, the Fajardo/Ceiba Region included 280,000 residents, representing approximately 7.4 percent of the total population in Puerto Rico. The Region's population grew by 1.0 percent per year since 1990. Population growth in the Fajardo/Ceiba Region is projected to increase by 0.5 percent per year through 2025. Loiza and Las Piedras are projected to experience the highest growth rates in the Region, at 0.8 percent per year, while Ceiba and Naguabo are projected to experience lower growth rates of 0.3 percent per year. Note that these projections were prepared by the Puerto Rico Planning Board prior to the announcement of the closure of Roosevelt Roads.
 - Puerto Rico's economy is largely driven by the manufacturing sector, namely chemical and pharmaceutical manufacturing. Additionally, the service sector, including tourism, is a major economic driver in Puerto Rico.
 - Past case study research performed by CBRE Consulting indicates that Roosevelt Roads has many of the attributes necessary for a Science Park. There has been preliminary interest expressed by both the University of Puerto Rico and the Polytechnic University of Puerto Rico in locating select research and development efforts on the site. If one of the universities were to serve as an anchor for the park, the ability to attract additional public and private sector tenants would be greatly enhanced. There appears to be potential demand for a Science Park at Roosevelt Roads.
 - Potential demand for industrial development at Roosevelt Roads appears to be somewhat limited based on the current supply of general-purpose industrial buildings in the Fajardo/Ceiba Region and the corresponding vacancy rate in the Region. However, Roosevelt Roads does have an advantage in the presence of the base airport, which could be attractive to industrial users.
- Additionally, Roosevelt Roads has the potential to attract industrial owner-occupiers, such as pharmaceutical and high technology manufacturers.
- Although the location of Roosevelt Roads does not lend itself to shopping center development, due to a lack of expressway visibility and access, the site does have characteristics that could support other types of retail development. A grocery-anchored neighborhood shopping center could potentially be supported by local residents currently living in the area and future residents at Roosevelt Roads, if there were a significant number of residents on the site. Additionally, specialty retail adjacent to the water, could also be supportable if it is developed with the appropriate mix of adjacent uses (e.g. residential marina, lodging, and tourist-oriented facilities).
 - The lodging market in Puerto Rico has been stable or growing throughout the past ten years, as evidenced by the steady growth in the inventory of hotel rooms on the island. The Fajardo/Ceiba Region is known for its access to activities and amenities such as El Yunque, the sister islands of Vieques and Culebra, and water sport activities and golf, and is anticipated to experience increasing demand in the lodging market. Such demand could be captured by a potential lodging development at Roosevelt Roads, which could capitalize on the beauty of the site, its proximity to Vieques, and Culebra, and complementary land uses (such as a marina and a golf course) that could be accommodated on the site.
 - Interviews with planning executives at two major cruise lines resulted in the opinion that there is not sufficient demand for a tourism port at Roosevelt Roads because of the site's disadvantageous location from an itinerary planning perspective.

1. Includes the municipalities of Ceiba, Fajardo, Humacao, Las Piedras, Loiza, Luquillo, Naguabo, and Rio Grande.

- There appears to be good potential for a marina at Roosevelt Roads given its location within the Fajardo/Ceiba Region, where many of Puerto Rico's marinas are concentrated, as well as its proximity to Vieques and Culebra. However, the marina inventory in the eastern region could be increasing significantly in the coming years if proposed expansion plans at various marinas are executed, which could temper demand at Roosevelt Roads.
- Roosevelt Roads has several attributes that support the potential for ecotourism on the site, including existing mangroves that may be explored by hiking and/or kayaking excursions, canoeing and other forms of boating that may be launched from the existing marina on the site, and ecotourism-oriented visits that could be organized to the islands off the northeast coast of Puerto Rico, such as Vieques and Culebra. Given its location, coastal setting, and environmentally sensitive areas, Roosevelt Roads could be well positioned to cater to this growing tourism sector.
- In the near term, Roosevelt Roads is not proximate to job centers, which will temper demand for housing. However, the Fajardo/Ceiba Region is projected to require 13,000 new housing units by 2025 to keep up with population growth. Therefore, future demand for housing located at Roosevelt Roads could be strong, either for re-use of current housing or construction of new units, especially as jobs are attracted to Roosevelt Roads over time. The site attributes of Roosevelt Roads, including spectacular views and existing infrastructure including schools, hospital, etc., as well as the future improvements in access to San Juan via new highway construction, could make the site an attractive location for both the primary and second-home markets.
- The Roosevelt Roads site provides a unique opportunity to master plan approximately 8,600 acres of prime real estate on Puerto Rico's desirable eastern coast. Residential and lodging/resort uses appear to be the most readily supportable uses from a market perspective. These uses could serve as the impetus for complementary development including supporting retail and an expansion of the marina. The potential development of a Science Park on the site could drive greater and faster absorption of other land uses (including industrial, residential, and retail). Although initial interest in the site has been expressed by several universities, the true potential for future development of this type will need to be vetted through follow up discussions with these institutions.

Appendix A:

II. Economic & Demographic Conditions & Trends

Overview: Puerto Rico

CBRE Consulting assembled and analyzed comparative economic and demographic data including population, household, and income trends to help inform the real estate market analyses. Included were: 1990 Census data, 2000 Census data, and the Puerto Rico Planning Board's population projections through 2025. The data are displayed in Exhibits 1 through 4 and focus on three geographic areas: Puerto Rico, the San Juan Metropolitan Area², and the Fajardo/Ceiba Region, which includes the municipalities of Ceiba, Fajardo, Humacao, Las Piedras, Loiza, Luquillo, Naguabo, and Rio Grande.

According to the 2000 Census, Puerto Rico had a total population of slightly more than 3.8 million people (see Exhibits 1 and 2). Between 1990 and 2000, Puerto Rico experienced slight population growth of less than 1.0 percent per year, while the median age climbed from 28.4 to 32.1 years. The population was 98.8 percent Hispanic, with ethnic Puerto Ricans accounting for 95.1 percent of all residents. Median household income in Puerto Rico increased 62 percent between 1990 and 2000, from \$8,900 to \$14,400, reflecting a compound annual growth rate of 4.9 percent. While employment was strongest in the education, health and social services, manufacturing, and retail trade sectors, only 40 percent of the population 16 years old and older was in the labor force. In February 2004, Puerto Rico's unemployment rate stood at 10.3 percent, according to the United States Department of Labor's Bureau of Labor Statistics. In fiscal year 2002, the

most recent year for which data were available, real Gross National Product declined 0.2 percent in Puerto Rico. This can be explained by the Puerto Rican economy's heavy dependence on the United States' economy, whose well-documented downturn has negatively affected Puerto Rico.

San Juan has long been the commercial center for Puerto Rico. In addition to being the island's capital city, San Juan is the hub of the primary metropolitan area, which houses about 30 percent of the island's total population and households. As displayed in Exhibit 2, Metropolitan San Juan's population was relatively more affluent and slightly older than the island-wide average in 2000, with a median household income ranging between \$12,852 and \$26,211 and median age ranging between 30.8 and 35.0 years³. Although poverty in most of the municipalities within the Metropolitan Area was significantly less than the island-wide average of 44.6 percent, Catano was higher with 46.7 percent of its residents below the poverty line.

As shown in the following table, Puerto Rico's population is projected to grow by 11 percent to 4.2 million residents by 2025, according to government projections. The most significant population growth is projected for Toa Alta, a municipality directly west of San Juan, which is expected to grow by 25,000 residents (38.7 percent), while Catano is expected to see the largest decline in population (negative 1.7 percent).

2. The San Juan Metropolitan Area includes the following municipalities: Bayamon, Carolina, Catano, Guaynabo, San Juan, and Trujillo Alto.
3. Median household income and median age data are only available by municipality. As a result, a range is cited for the San Juan Metropolitan Area.

	Municipality	2000 Population	2025 Population	Amount	Percent
GREATEST GROWTH	<i>Toa Alta</i>	64,261	89,125	24,864	38.7%
	<i>Gurabo</i>	36,878	46,091	9,213	25.0%
	<i>Penuelas</i>	26,794	33,099	6,305	23.5%
	<i>Las Piedras</i>	34,600	42,520	7,920	22.9%
	<i>Loiza</i>	32,617	40,048	7,431	22.8%
LEAST GROWTH	<i>Bayamon</i>	224,153	231,381	7,228	3.2%
	<i>San Juan</i>	434,519	443,778	9,259	2.1%
	<i>Mayaguez</i>	98,393	98,454	61	0.1%
	<i>Vieques</i>	9,107	9,063	(44)	(0.5%)
	<i>Catano</i>	30,027	29,513	(514)	(1.7%)
	<i>Puerto Rico</i>			400,383	10.5%

The Fajardo/Ceiba Region

The northeastern coast of Puerto Rico is home to Roosevelt Roads, and for the purposes of this report, CBRE Consulting examined the demographic and economic characteristics of the eight municipalities within the Fajardo/Ceiba Region (see Exhibit 2). In 2000, the Region had a total of 280,000 residents, having grown 1.0 percent per year since 1990 (see Exhibits 3 and 4). Median household income ranged from \$11,200 to \$16,400 in the eight municipalities, with Ceiba claiming the most affluent population in the Region (\$16,400). Loiza and Naguabo had the two lowest median household income figures, at \$11,200 and \$11,500, respectively. The average household size in the Region was 3.05, higher than the island-wide average and primarily attributable to the 3.38 average household size in the municipality of Loiza. Fajardo and Ceiba each trailed the island-wide average in household size, with 2.86 and 2.92 persons per household, respectively. The median age in the Region was consistent with the island average, ranging from 27.2 to 32.2 years. The largest municipality in terms of population was Humacao, while Ceiba was the smallest.

The labor force in the Fajardo/Ceiba Region was consistent with the island average, with 39.9 percent of the 16-and-older population in the job market. The strongest employment sectors were also consistent with the island, as education, health, and social services and manufacturing were the sectors with the highest employee counts.

Population growth in the Fajardo/Ceiba Region is projected to increase by 0.5 percent per year through 2025. Loiza and Las Piedras are projected to experience the highest growth rates in the Region, at 0.8 percent per year, while Ceiba and Naguabo are projected to experience lower growth rates of 0.3 percent per year. (Note that these projections were prepared by the Puerto Rico Planning Board prior to the announcement of the closure of Roosevelt Roads.)

Puerto Rico's economy is largely driven by the manufacturing sector, which generated 45.7 percent of net domestic income in 2002, according to the Government Development Bank. The service sector, including tourism, is also a significant force on the island, having accounted for 51.7 percent of non-farm payroll employment and 40.5 percent of net domestic income in fiscal year 2002. Within key economic sectors, the following trends have emerged in recent years:

- The chemical industry led the manufacturing sector in fiscal year 2002, with a 63.7 percent share of net domestic manufacturing income. Other key industries within the manufacturing sector include machinery and food.
- The widening presence of the pharmaceutical industry in Puerto Rico has positively impacted the island's economy in recent years. The industry experienced a 6.9 percent and 6.3 percent increase in employment in calendar years 2001 and 2002, respectively, which were the highest growth rates in many years. The pharmaceutical industry has been the driving force behind the island's growth in exports in recent years. Drug exports more than tripled between fiscal years 1997 and 2002, from \$8.3 billion to \$31.1 billion.
- Tourism represents a small segment of the economy when measured in terms of direct expenditures by non-resident tourists, but the importance of tourism is much greater when the impact of employment and income multipliers are considered. Steady growth in visitor expenditures over the past decade not only helped the tourism industry, their effects rippled into related industries such as transportation, communications, and retail trade. The tourism sector has been growing in terms of the number of visitors coming to the island, visitor expenditures, and the total inventory of hotel rooms on the island.

Key Industries in Puerto Rico

Appendix A:

III. Overview of Real Estate Market Trends & Conditions

Introduction CBRE Consulting analyzed real estate market data for Puerto Rico and the region surrounding Roosevelt Roads from a variety of sources, including the Puerto Rico Industrial Development Company (“PRIDCO”), the Puerto Rico Tourism Company, the Puerto Rico Ports Authority, and the U.S. Census, to gain an understanding of the local real estate market. Additionally, CBRE Consulting interviewed a number of local professionals in various industries as well as local governmental departments to better understand the science park, industrial, retail, tourism, and residential markets. These interviews provided a significant amount of data on the local real estate market because the area lacks a conventional real estate database or entity that collects and reports market statistics.

Location Roosevelt Roads is located on the eastern coast of Puerto Rico, just east of and adjacent to the small municipality of Ceiba. Northeast Puerto Rico is home to the largest rain forest in the U.S. National Forest System (El Yunque) and Luquillo Beach, which is one of the best-known beaches on the island. It is also known for golf courses, diving, snorkeling, kayaking, fishing and sailing trips from Fajardo, historic plazas, and its proximity to the sister islands of Vieques and Culebra (the Spanish Virgin Islands). Vieques is known for its bioluminescent bay and a recently restored lighthouse while Culebra has a nature preserve and many attractive beaches.

Science Park Market A science park (“Science Park”) is defined as “an organization managed by specialized professionals, whose main aim is to increase the wealth of its community by promoting the culture of innovation and the competitiveness of its associated businesses and knowledge-based institutions. To enable these goals to be met, a Science Park stimulates and manages the flow of knowledge and technology amongst universities, R&D institutions, companies, and markets; it facilitates the creation and growth of innovation-based companies through incubation and spin-off processes; and provides other value-added services.”⁴ A Science Park may include private sector users and/or an affiliation with a university or other public sector users (e.g., governmental laboratories).

4. International Association of Science Parks.

Science Park Location Criteria

Although there are no existing Science Parks in Puerto Rico at this time, location criteria for Science Parks in the mainland U.S. may be utilized to help assess the potential for a Science Park at Roosevelt Roads. In a recent research study, CBRE Consulting analyzed Science Park attributes by researching select successful Science Parks including the following: Stanford Research Park in Palo Alto, California; Princeton Forrester Center in Plainsboro, New Jersey; Johns Hopkins Bayview Research Campus in Baltimore, Maryland; University of California at San Francisco in San Francisco, California; and Irvine University Research Park in Irvine, California. Case study research found consistency in several key attributes for successful Science Parks, including:

- Convenient transportation access from desirable residential communities or neighborhoods where researchers are likely to reside. Both vehicular and public transit access are important.
- Sufficiently large site to accommodate a range of uses, including academic research laboratories, space for start-up firms, and established successful firms.
- An attractive “lifestyle” environment that provides landscaped open space and recreational facilities. Adjacent open space and nearby commercial districts providing amenities such as restaurants, a hotel, support retail, and services are important factors. A campus environment can be achieved in an urban area if the site is large enough to benefit from specialized urban design applications.

A June 1998 study of 18 international Science Parks by the Association of University Related Research Parks provides insight into the critical components of successful parks. The major components common to 75 percent of Science Parks surveyed included:

- Affiliation with academic medical center
- Wet lab space
- Incubator space
- High speed data links

Major characteristics of the surveyed parks included:

- Average park size was 150 acres accommodating 1.4 million square feet of building area.
- Average annual absorption for private space was 60,000 square feet, ranging from 25,000 to in excess of 200,000 square feet.
- Universities, governments, or non-profit entities developed 90 percent of the survey parks.
- Economic benefits, including job creation, were the main reason for Science Park development.

In a second recent study, CBRE Consulting analyzed several other Science Parks, including the following: Mission Bay in San Francisco, California; University Park at Massachusetts Institute of Technology in Cambridge, Massachusetts; and Virginia Biotechnology Research Park in Richmond, Virginia. Case study research identified critical elements to develop, grow, and attract companies to a Science Park, including:

- Close proximity to a major biotechnology research university, research clinics, laboratories, or major biotechnology/ pharmaceutical company bearing recognition as a leader in one or more scientific fields relevant to the park’s planned orientation.

- The presence of a high-quality human resources pool, generally provided by local industry and universities.
- Presence of a strong business infrastructure, such as lawyers, accountants, venture capitalists, and suppliers.
- Availability of good quality housing nearby, suitable for research scientists who command good salaries and who are accustomed to excellent housing.
- Provision of transportation access to the park that allows reasonable commute times from housing areas to the research park and between the research park and university.
- Provision of regional transportation access, including air access, both for transporting personnel and for transporting highly valued cargo; excellent highway access is important for connecting to nearby major cities.
- Presence of environmental amenities, such as views, landscaping, open space, jogging trails, and exercise facilities.
- Provision of a high quality of living including climate, quality of infrastructure, cultural, and recreational amenities.

University Interest in Roosevelt Roads

Roosevelt Roads has the potential to offer many of these location criteria to prospective tenants in a Science Park, given its large size, proximity to housing (both on and off the base), natural beauty, and complementary uses envisioned as part of the redevelopment plan. It would be likely that a university would be necessary to anchor a Science Park at Roosevelt Roads. With renovation of some of the existing single-family housing, Roosevelt Roads could provide an appealing package to prospective Science Park

tenants including office buildings and housing in a highly attractive physical setting. Additionally, a university anchor would attract scientists, researchers, and graduate students to the site, who might utilize the well-educated workforce in Puerto Rico. Several universities and research institutions have expressed interest in the possible use of Roosevelt Roads as a future location for science-related activities. They are detailed as follows.

- The University of Puerto Rico has a Primate Center at Sabana Seca, which is approximately 10 miles west of San Juan. The University also operates the Cayo Santiago field station, located on an island off the coast of Puerto Rico to the south of Roosevelt Roads. Cayo Santiago is a free-ranging colony of rhesus monkeys, which is used primarily for behavioral research. Researchers from institutions such as Harvard University and Columbia University visit Cayo Santiago every year to study the monkeys with their staff. The University is in need of housing as well as support facilities such as offices, laboratories, a vivarium, and lecture halls near the island. The University is interested in combining its primate research with a tourism component such as a natural history museum and planetarium to attract visitors and provide outreach regarding its mission. Such a tourism/outreach component has been integrated in other primate centers in the U.S. such as the Tulane National Primate Research Center and the Washington National Primate Research Center.

- Polytechnic University of Puerto Rico has expressed interest in locating a Center for Ocean Research and Engineering at Roosevelt Roads. Requirements for the facility would include approximately 10,000 square feet of building space for classrooms, laboratories, and offices. The space would need to be located close to a marina/dock that could handle boats up to 100 feet in length.

- Industry/University Research Consortium (“INDUNIV”) is an organization committed to promoting collaboration

among industry, academia, and government to solve scientific problems of interest to Puerto Rico. Members of INDUNIV include Abbott, Amgen, Hewlett-Packard, Pfizer, the Polytechnic University of Puerto Rico, the University of Puerto Rico System, and PRIDCO, among others. INDUNIV is planning future science centers, including ones focused on pharmaceutical and biotechnology regulation, biomedical materials science, dry delivery systems, and biopharmaceutical science and engineering. Roosevelt Roads could potentially be the location of a future INDUNIV science center.

Conclusions

Roosevelt Roads has many of the attributes necessary for a Science Park, as identified by past case study research performed by CBRE Consulting. Given the potential interest expressed by both the Polytechnic University of Puerto Rico and the University of Puerto Rico in locating select research and development efforts on the site, there appears to be potential for a Science Park at Roosevelt Roads. If one of the universities were to serve as an anchor for the park, the ability to attract additional public and private sector tenants would be greatly enhanced.

Industrial Park Market

Puerto Rico

The industrial market in Puerto Rico is characterized primarily by owner-occupied manufacturing facilities (including, in particular, pharmaceuticals) and for-lease properties owned by PRIDCO. PRIDCO estimates that it owns approximately 88 percent of the total industrial space available for lease in Puerto Rico. As of April 1, 2004, PRIDCO owned approximately 24.8 million square feet of industrial buildings. Of this total, approximately 75 percent was leased. Of the 25 percent of inventory that was vacant, 23 percent was reserved for prospective tenants and 17 percent was under negotiation. Historical construction of PRIDCO-owned industrial facilities is detailed in the following table.

Table A.2 <i>Historical Construction of PRIDCO-Owned Industrial Facilities Completed for Fiscal Years Ended June 30</i>	Year	Square Feet
	1998	276,696
	1999	336,826
	2000	144,698
	2001	240,228
	2002	133,693
	Total	1,132,141

Sources: PRIDCO, and CBRE Consulting.

As detailed in Table A.2, PRIDCO constructed on average just over 225,000 square feet of new industrial space per year between 1998 and 2002. During this five-year period, the overall supply of industrial space owned by PRIDCO increased by the modest amount of approximately 4.7 percent. Anticipated construction of future industrial facilities by PRIDCO is detailed in the following table

Table A.3
Projected Construction of Industrial Facilities to be Completed During Fiscal Years Ending June 30

Year	Square Feet
2003	505,000
2004	563,000
2005	428,000
2006	447,000
2007	467,000
Total	2,410,000

Sources: Puerto Rico Planning Board, and CBRE Consulting.

As detailed in Table A.3, as of March 31, 2003, PRIDCO projected that it would construct a total of just over 2.4 million square feet of industrial space between 2003 and 2007, or an average of approximately 482,000 square feet per year. During this five-year period, it is projected that PRIDCO's overall inventory will increase by approximately 9.5 percent, double that which was experienced between 1998 and 2002.

Historically, PRIDCO constructed general-purpose buildings in advance of demand and special industrial buildings on demand. For several years prior to fiscal year 2003, PRIDCO did not construct general-purpose buildings in advance of demand but began to do so again in that fiscal year. As a result, four new projects and four remodeling projects were under development in 2003. These circumstances account for the difference between the average construction per year that occurred between 1998 and 2002 and the construction that is projected to occur between 2003 and 2007

Fajardo/Ceiba Region

As of April 1, 2004, PRIDCO owned approximately 2.5 million square feet of industrial buildings in the Fajardo/Ceiba Region. This accounted for approximately 10 percent of its island-wide inventory. The following table details the allocation of industrial space by municipality in the Region.

	Ceiba	Fajardo	Humacao	Las Piedras	Loiza	Luquillo	Naguabo	Rio Grande	Total
Total Inventory	177,031	276,313	820,077	299,148	113,667	268,995	222,406	354,459	2,532,096
Vacancy Rate	13%	21%	11%	0%	20%	21%	10%	57%	19%

Table A.4
PRIDCO-Owned Industrial Facilities in the Fajardo/Ceiba Region As of April 1, 2004

Sources: PRIDCO, and CBRE Consulting.

As shown in Table A.4, the greatest amount of PRIDCO-owned industrial space in the Fajardo/Ceiba Region is located in Humacao (32 percent), followed by Rio Grande with 14 percent and Las Piedras with 12 percent. The overall vacancy rate for the Region is 19 percent, and the individual municipality vacancy rates range from zero percent to 57 percent. Ceiba, the municipality closest to Roosevelt Roads, has the smallest amount of industrial space with just over 177,000 square feet and a current vacancy rate of 13 percent. In addition to the PRIDCO-owned industrial facilities in the area, Roosevelt Roads has some existing industrial and warehouse buildings near the base airport that may be reused in conjunction with future airport activity

Conclusions

With just over 2.5 million square feet of industrial space owned by PRIDCO (10 percent of PRIDCO’s total inventory of industrial space in Puerto Rico) and an average vacancy rate of 19 percent, the current supply of industrial space in the Region appears to be adequate to serve its needs. This would indicate that the potential for industrial development at Roosevelt Roads is somewhat limited unless it was for an owner-occupier such as a pharmaceutical manufacturing plant. However, Roosevelt Roads does have an advantage in the presence of the base airport, which could be attractive to potential industrial users. These future users would benefit from proximity to the airport if their operations require cargo transport, charter flights, or other aviation needs that might be fulfilled through the base airport. Proximity to the base airport could reduce the additional costs and inconvenience of using a facility that is farther away from their operations

Retail Market *Puerto Rico*

Driven by consistently strong sales, Puerto Rico's retail market experienced a development boom in the 1990s, with about 11 million square feet of new retail space constructed between 1996 and 1999. The market is dominated by shopping centers with big box retailers as anchor tenants and demand for retail space in Puerto Rico continues to be strong. Although development has stalled since the expansion period of the 1990s, the island-wide vacancy rate is approximately 5.0 percent and rental rates have been stable, according to James DeWinter, CB Richard Ellis' Director of Retail Services for Latin America and the Caribbean. In fact, major retailers located in Puerto Rico continue to seek expansion opportunities, while big box retail chains without a presence in Puerto Rico look for opportunities to penetrate the market.

As shown in Table A.5 at right, retail sales in Puerto Rico increased 46 percent between 1992 and 1997, the most recent years for which data were available. Particularly strong sales occurred in Automotive Dealerships, which accounted for 14 to 20 percent of total retail sales and increased twofold in the five-year period.

Retail Category	1992 (millions)	1997 (millions)	Change
Building Materials	\$616	\$973	58.0%
General Merchandise	\$1,503	\$2,230	48.4%
Food	\$2,960	\$3,621	22.3%
Automotive dealers	\$1,688	\$3,396	101.2%
Gasoline Service Stations	\$711	\$1,141	60.5%
Apparel and Accessories	\$1,205	\$1,414	17.3%
Home Furniture	\$772	\$1,119	44.9%
Eating & Drinking	\$934	\$1,445	54.7%
Drug and Proprietary	\$657	\$897	36.5%
Misc. Retail	\$661	\$853	29.0%
Total	\$11,707	\$17,088	46.0%

Table A.5

Sources: U.S. Census Bureau; and CBRE Consulting

Table A.6
Sales in Retail
Establishments, by
Municipality
1997

Sources: U.S. Census
Bureau, and CBRE
Consulting

Geographic Area	Total Retail Sales (000s)	Total Establishments
Puerto Rico	\$17,087,950	14,582
San Juan Region	\$8,540,285	5,414
Fajardo/Ceiba Region	\$884,889	877
Ceiba	\$13,656	32
Fajardo	\$236,936	207
Humacao	\$365,303	303
Las Piedras	\$69,273	120
Loiza	\$18,796	37
Luquillo	\$32,184	56
Naguabo	\$22,138	40
Rio Grande	\$90,603	82

Table A.6 identifies the San Juan Region as Puerto Rico's primary retail market, having accounted for half of total retail sales in Puerto Rico in 1997. Among its many retail offerings, the San Juan Region boasts two shopping centers, Plaza las Americas and Plaza Carolina, with more than one million square feet of space. Although the San Juan population could support additional retail space, a scarcity of suitable land prevents further large-scale development. Sales in the Fajardo/Ceiba Region were more modest, with Fajardo and Humacao constituting the primary retail centers in the Region. The PMI Realty-owned shopping centers in Humacao (Plaza Palma Real) and Fajardo (Plaza Fajardo) are currently each 100 percent occupied and generate \$370 and \$340 in sales per square foot, respectively

Conclusions

The majority of shopping centers in Puerto Rico are on major thoroughfares or expressways with good visibility and access. Developers and retailers insist on these characteristics for community or larger shopping centers, like those found in the San Juan Region and Plaza Fajardo in Fajardo. Roosevelt Roads does not fit the criteria for shopping center development because of its location off the highway. Along the same lines, big box retailers are not likely to be attracted to existing buildings at Roosevelt Roads, since they too demand highway visibility and good access.

Roosevelt Roads does have characteristics that could lend the site to other types of retail development. A grocery-anchored neighborhood shopping center could potentially be supported by local residents currently living in the area and future residents at Roosevelt Roads. However, the Amigo's grocery store in Ceiba does not perform particularly well, and Roosevelt Roads would need to attract a significant number of new residents in order to support an additional grocery store in the area. Specialty retail, adjacent to the water, could also be supportable if it is developed with the appropriate mix of adjacent uses (e.g., residential, marina, lodging, and tourist-oriented facilities).

Tourism & Lodging Markets

Although tourism in Puerto Rico represents a small segment of the economy when measured in terms of direct expenditures by non-resident tourists, its overall importance and impact is much greater in terms of employment and income multipliers. There were approximately 4.4 million visitors to Puerto Rico during fiscal year 2002. These visitors spent a total of nearly \$2.4 billion during their time on the island. Total direct, indirect, and induced employment in the tourism industry during fiscal year 2002 was just over 56,000 persons.

Lodging: Puerto Rico

There were a total of 12,768 hotel rooms⁵ in Puerto Rico as of June 30, 2002 (see Exhibit 6). The inventory of hotel rooms was split between metropolitan area hotels and non-metropolitan area hotels. Approximately 76 percent of the hotel rooms were in tourist hotels, which are facilities that include one of the following attractions: casino, restaurant, beach, swimming pool, water sport facilities, and outdoor sport facilities. The island-wide inventory of hotel rooms has been growing steadily during the past ten years, experiencing a compound annual growth rate of 4.1 percent during the 1993-2002 period, which equates to an average addition of 465 rooms to the total inventory per year.

The average annual occupancy rate for all hotels and paradores in Puerto Rico has been declining or stagnant in recent years, much like hotel occupancy rates in other regions within the U.S. (see Exhibit 7). The average annual occupancy rate for fiscal year 2002 was 63 percent for all hotels, 70 percent for metropolitan area hotels, 58 percent for non-metropolitan area hotels, and 46 percent for paradores. These rates indicate a decrease of approximately 12 percent from the highest rates achieved during the 1993 to 2002 period, in fiscal year 1999. During the 1993 to 2002 period, the average annual occupancy rate ranged from 63 percent to 72 percent, with the peak occurring in 1999 and the low occurring in 2002.

The Puerto Rico Trade and Convention Center District is under development in San Juan, situated on 113 acres of land and anticipated to encompass over 4.0 million square feet upon buildout. The mixed-use development is anchored by a 1.3 million-square-foot convention center, which is expected to be completed in September 2005. The convention center will be complemented by a hotel (which includes 81,000 square feet of meeting space), 717,000 square feet of office space, 163,000 square feet of commercial space (including a 62,000-square-foot cinema), and 225 residential units. As of September 2003, the convention center was 29 percent complete.

Lodging: Fajardo/Ceiba Region

The northeast region of Puerto Rico is regarded as one of the premiere destinations on the island due to its proximity to El Yunque and the sister islands of Vieques and Culebra (known as the Spanish Virgin Islands) and its abundance of golf courses and marinas. Several well-known hotels are located in the Fajardo/Ceiba Region, including the Westin Rio Mar Beach Resort and Ocean Villas in Rio Grande and the Wyndham El Conquistador Resort and Las Casitas Village in Fajardo. The Westin Rio Mar Beach Resort is a 600-room property with two 18-hole championship golf courses. Adjoining the resort is the Ocean Villas development, which includes 58 one, two, and three-bedroom beachfront condominium villas. Approximately 65 percent of the Westin Rio Mar's business is groups while the remaining 35 percent is leisure.

The Wyndham El Conquistador Resort is a 750-room property with eleven restaurants, casino, 18-hole golf course, spa and fitness center, shopping arcade, marina, and offshore island with water sport activities and beaches. Las Casitas Village offers 144 deluxe rooms and suites in 90 condominium-hotel villas. The units range in size from one to three bedrooms and are operated by the resort under a rental agreement with the condominium owners. Approximately 60 percent of El Conquistador's business is groups while the remaining 40 percent is leisure.

5. Includes establishments endorsed by the Puerto Rico Tourism Company only.

6. Metropolitan area comprises San Juan's urban areas as classified by the Puerto Rico Planning Board, including the municipalities of San Juan, Bayamon, Guaynabo, Catano, Trujillo Alto, and Carolina. Non-metropolitan area includes urban and rural areas other than the San Juan Metropolitan Area.

There are several new resorts that are under construction or planned in the Fajardo/Ceiba Region, as detailed in the table below.

	Project	Municipality	Total New Rooms	New Hotel Rooms	New Condo/ Hotel Keys	New Villas Turisticas	New Timeshare Rooms	Start of Construct.	Start of Operation	Table A.7 <i>Under Construction and Planned Resort Projects in the Fajardo/Ceiba Region</i>
UNDER CONSTRUCTION	<i>InterContinental Cayo Largo Resort</i>	<i>Fajardo</i>	<i>314</i>	<i>314</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>2000</i>	<i>n/a</i>

PLANNED	<i>Villa Castillo</i>	<i>Humacao</i>	<i>24</i>	<i>0</i>	<i>0</i>	<i>24</i>	<i>0</i>	<i>Jan. 2004</i>	<i>Oct. 2004</i>	
	<i>Fairmont Resort Coco Beach</i>	<i>Rio Grande</i>	<i>412</i>	<i>412</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>Jun. 2004</i>	<i>Sep. 2006</i>	
PRELIMINARY PLANNING	<i>Cotton Bay Resort</i>	<i>Naguabo</i>	<i>256</i>	<i>100</i>	<i>156</i>	<i>0</i>	<i>0</i>	<i>n/a</i>	<i>n/a</i>	
	<i>J.W. Marriott Dos Mars (1st phase)</i>	<i>Fajardo</i>	<i>350</i>	<i>350</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>n/a</i>	<i>n/a</i>	
	<i>King's Place Resort Spa & Casino</i>	<i>Rio Grande</i>	<i>110</i>	<i>110</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>n/a</i>	<i>n/a</i>	
	<i>Mandarin Oriental Palmas del Mar</i>	<i>Humacao</i>	<i>252</i>	<i>152</i>	<i>100</i>	<i>0</i>	<i>0</i>	<i>n/a</i>	<i>n/a</i>	
	<i>San Miguel Partners (Four Seasons)</i>	<i>Luquillo</i>	<i>375</i>	<i>250</i>	<i>50</i>	<i>0</i>	<i>75</i>	<i>n/a</i>	<i>n/a</i>	

The Fairmont Resort at Coco Beach is a five-star resort that is anticipated to include a spa and two 18-hole golf courses. The Inter-Continental Cayo Largo Resort is a luxury resort that will include four restaurants, two bar and lounge facilities, meeting space, spa and fitness center, 18-hole championship golf course, and tennis courts. Construction is presently 90 percent complete but due to ongoing legal issues, the anticipated completion date and commencement of operations is unknown. Las Casitas II is the second phase of the Las Casitas development at the Wyndham El Conquistador, which is slated to add 67 luxury villas and two swimming pools to the Las Casitas property. The Paradisus Sol Melia is an all-inclusive resort with hotel, spa, and meeting facilities. This property will be Puerto Rico's first all-inclusive resort.

Lodging Conclusions

The lodging market in Puerto Rico has been relatively stable throughout the past ten years, even after the events of September 11, 2001, due to Puerto Rico's aggressive marketing strategy, which offered travel incentives and significant discounts. The steady growth in the inventory of hotel rooms on the island indicates continuous demand for new product that appeals to both business and leisure travelers. Although there are a significant number of projects under construction or planned in the Fajardo/Ceiba Region, only three are under construction currently, with two of the three having planned openings in 2004. As the Region is known for its access to activities and amenities such as El Yunque, the sister islands of Vieques and Culebra, and water sport activities and golf, it is anticipated to experience increasing demand in the lodging market. Such demand could be captured by a potential lodging development at Roosevelt Roads, which could capitalize on the beauty of the site, its proximity to Vieques, and Culebra, and complementary land uses (such as a marina and a golf course) that could be accommodated on the site.

The Cruise Industry: Puerto Rico

The Caribbean is a popular cruise destination and currently San Juan and Ponce are the only ports in Puerto Rico that host cruise lines. Cruise ship trips to Puerto Rico totaled 625 in 2002, with 1,276,301 cruise ship visitors and \$129.1 million in spending. The number of cruise ship trips to Puerto Rico has declined during the past ten years, decreasing at an average annual rate of -3.0 percent per year during the 1993–2002 period, although the total number of cruise ship visitors has increased at a rate of 2.3 percent per year during that same period. Puerto Rico is disadvantaged compared to other Caribbean ports because cruise lines generally make San Juan their first port of call in the Caribbean, en route from homeports in Florida, which results in ships arriving late in the day and spending very few hours on the island before leaving for the next port.

CBRE Consulting interviewed a representative within the planning department at Carnival Cruise Lines to gauge its potential interest in the possible creation of a tourism port at Roosevelt Roads. At this time, Carnival has no interest in the Roosevelt Roads site because the location does not work from an itinerary planning perspective either as a homeport or as a destination within Puerto Rico. Carnival did not expect that its opinion would change in the foreseeable future.

CBRE Consulting also interviewed a representative within the planning department at Norwegian Cruise Line ("NCL") and found out that NCL has made a decision to leave Puerto Rico altogether after April 2004. NCL currently has one ship that uses San Juan as a homeport and that ship has been redeployed to Hawaii starting May 2004. Furthermore, the NCL ships that cruise in the Eastern Caribbean are not scheduled to make port of call stops in San Juan. At this time, NCL does not have any plans to homeport a ship in Puerto Rico or to make any consistent port of call stops in Puerto Rico. As a result, NCL would not consider Roosevelt Roads as a potential port (homeport or port of call) in the near term or foreseeable future.

Cruise Industry Conclusions.

Due to Puerto Rico's location within the Eastern Caribbean, most cruise ships that make port of call stops in San Juan do so for only a partial day, often in the afternoon and evening. As a result, San Juan is an attractive destination because passengers can enjoy city activities during their brief time on the island. Both interviews with planning executives at two major cruise lines resulted in the opinion that there is not sufficient demand for a tourism port at Roosevelt Roads because of the site's disadvantageous location from an itinerary planning perspective.

7. *Incentive Program to Promote & Regulate Nautical Tourism in Puerto Rico*, October 6, 2003 by Dornbusch Associates.

Marinas and Nautical Tourism: Puerto Rico

The marinas in Puerto Rico primarily cater to individual boat owners, as opposed to nautical tourism, which includes charter fleets and mega yachts that are available for rent by tourists with or without crews. There are currently no charter fleets and very few mega yachts based in Puerto Rico. Puerto Rico does offer some competitive advantages for nautical tourism such as access to the sister islands of Vieques and Culebra, the relatively inexpensive cost of fuel, and an infrastructure of services and facilities such as airports, hotels, restaurants and shops that appeal to nautical tourists. However, Puerto Rico's position to attract nautical tourists is disadvantaged by the excise tax levied on boat owners and the lack of development incentives offered to induce investment in boats used for nautical tourism.

Marinas and Nautical Tourism: Fajardo/Ceiba Region.

There are a total of 41 marinas in Puerto Rico, which are distributed throughout the island but are concentrated (approximately 70 percent) in the eastern region (which includes the municipalities of Fajardo, Ceiba, Naguabo, Humacao, Yabucoa, and Maunabo).⁸ In the eastern region, there are a total of approximately 3,600 spaces, which are distributed into wet slips (approximately 62 percent) and dry stacks (approximately 38 percent), as show in Table A.8 below. Although specific occupancy data were not available for the marinas, anecdotal information suggests that occupancy is high for smaller slips (90 percent or greater) and low for larger slips (46 feet and up).

Marina Name	Wet Slips	Dry Stacks	Total Spaces
<i>Puerto Chico</i>	278	276	554
<i>Sea Lovers</i>	110	0	110
<i>Villa Marina</i>	266	576	842
<i>Puerto del Rey</i>	1,000	524	1,524
<i>El Conquistador</i>	22	0	22
<i>Isleta Marina</i>	240	0	240
<i>Palmas del Mar</i>	230	0	230
<i>Roosevelt Roads</i>	72	0	72
Total	2,218	1,376	3,594

Table A.8
Marinas in the Eastern Region of Puerto Rico

Sources: Robert F. McCloskey Associates; Puerto del Rey, Inc.; and CBRE Consulting.

8. Robert F. McCloskey Associates

Several marinas in the eastern region have plans for potential wet slip expansion. These potential expansions could increase the inventory in the region by approximately 1,000 wet slips, or 27 percent, as detailed in the following table.

Table A.9
*Eastern Region
Marinas with
Planned
Expansions*

*Sources: Robert F
McCloskey Associates;
Puerto del Rey, Inc.; and
CBRE Consulting.*

Marina Name	Wet Slip Expansion
<i>Puerto Chico</i>	<i>150</i>
<i>Sea Lovers</i>	<i>100</i>
<i>Palmas del Mar</i>	<i>180</i>
<i>Sun Bay</i>	<i>282</i>
<i>Fajardo Bay (Puerto Real)</i>	<i>250</i>
Total	962

Roosevelt Roads has an existing marina that includes 72 boat slips and 25 moorings. Each boat slip is approximately 12 feet in width and most are approximately 31 feet long, with a few in the range of 17 to 25 feet. The facility is generally in good condition as it is relatively new.

Marinas and Nautical Tourism Conclusions.

There appears to be good potential for a marina at Roosevelt Roads given its location within the Fajardo/Ceiba Region, where many of Puerto Rico’s marinas are concentrated, as well as its proximity to Vieques and Culebra due to the attractions on those islands, such as beaches, snorkel/dive sites, restaurants, shops, and the bioluminescent bay in Vieques. However, the inventory in the eastern region could be increasing significantly in the coming years if possible expansion plans at various marinas are executed, which could temper demand at Roosevelt Roads.

Ecotourism

“Ecotourism” and “soft adventure” are the fastest growing tourism sectors in the United States. Roosevelt Roads potentially could be an ideal site for ecotourism due to its location and setting. CB Richard Ellis Consulting gathered the following information on ecotourism for various projects in recent years.

According to Eco-Tourism International, “Tourism is changing rapidly as nature, heritage, and recreational destinations become more important, and as conventional tourism is forced to meet tougher environmental requirements.” Ecotourism is defined by The Ecotourism Society as “responsible travel to natural areas, which conserves the environment and sustains the well-being of local people.”

The Ecotourism Market: In the late 1990s, a survey of 3,342 households by Bruskin Goldring for Visit Florida, designed to produce a representative sample of the 47 mainland states outside Florida, found that regardless of the destination of their vacation, respondents had an even chance (48.1 percent) of participating in nature-based activities during their trip. Furthermore, 30 percent of respondents planned trips that focused some or a majority of time on nature-based activities.

Green Travel Products: The Travel Industry Association of America estimated in the late 1990s that 83 percent of U.S. travelers are inclined to support “green” travel companies and are willing to spend an average of 6.2 percent more for travel services and products provided by environmentally responsible travel suppliers. For example, an additional \$2 million in new business and a higher occupancy rate was achieved at the Boston Plaza Hotel in Boston after the hotel implemented environmentally conscious initiatives, energy efficient lighting, water efficient showerheads, comprehensive recycling, and thermopane windows and a filtration system that allow the hotel to recycle two-thirds of its water and retain most of its heat.

Recreation Activity: A survey of 2,009 Americans conducted by the Recreation Roundtable in recent years reported that nearly six in ten respondents participate in outdoor recreation at least monthly. Their motivations are fun, relaxation, stress relief, experiencing nature, and exercise. Midwesterners are the most active, with 66 percent taking part in outdoor recreation. Northeasterners are the second most active at 59 percent, followed by Westerners at 56 percent, and Southerners at 51 percent.

Wildlife-Watching: The National Survey of Fishing, Hunting, and Wildlife-Associated Recreation in the late 1990s found 62.9 million U.S. residents (31 percent of the U.S. population 16 years and older) enjoyed a variety of wildlife-watching activities. A total of 60.8 million people enjoyed wildlife around their homes while 23.7 million took trips away from their homes for the primary purpose of participation in wildlife-watching recreation. Wildlife-watching participants spent \$9.4 billion on trips to pursue their activities.

Adventure Travel: According to the Adventure Travel Society, adventure travel is a \$200 billion business in the United States. In the U.S. there are 10,000 adventure travel companies and 147 million people have experienced some form of adventure travel.

Ecotourism Conclusions: Roosevelt Roads has several attributes that support the potential for ecotourism on the site, including existing mangroves that may be explored by hiking and/or kayaking excursions, canoeing and other forms of boating that may be launched from the existing marina on the site, and ecotourism-oriented visits that could be organized to the islands off the northeast coast of Puerto Rico, such as Vieques and Culebra. Several countries are leveraging the ecotourism trend by developing programs that showcase natural and cultural resources in an environmentally and socially responsible approach, while providing an exciting and compelling experience for

tourists. Given its location, coastal setting, and environmentally sensitive areas, Roosevelt Roads could be well positioned to cater to this growing tourism sector.

CBRE Consulting analyzed current and historic comparative housing data including total housing units, annual addition of new units, and recent sales data to gain an understanding of the residential market in Puerto Rico and assess the demand for housing at Roosevelt Roads. The data are displayed in Exhibits 4, 8 and 9.

Estimated Inventory

Estimated Total Housing Units: According to the 2000 Census, there were 1.4 million total housing units in Puerto Rico, up from 1.2 million units in 1990, representing an average annual growth rate of 1.8 percent (see Exhibit 4). The majority of housing units in Puerto Rico, 73 percent, was owner-occupied. Owner-occupied housing values grew 8 percent per year between 1990 and 2000, reaching \$75,000 in 2000.

The Fajardo/Ceiba Region had 108,000 total housing units in 2000, according to the Census. The percentage of owner-occupied housing was higher than the island average, at 78 percent. The Region's vacancy rate of 16 percent was higher than the island average of 11 percent. Humacao had the greatest number of housing units and accounted for 21 percent of the total inventory in the Region, while Ceiba had the fewest units, and accounted for 6 percent of the inventory.

Estimated New Housing Units Authorized by Building Permits Per Year: Exhibit 8 shows the total number of residential building permits issued in Puerto Rico and the Fajardo/Ceiba Region between 1998 and 2003. During that period, 105,000 total permits were issued in Puerto Rico, reflecting an average of 17,500 units per year. The

Residential Market

total value of housing permits increased by over 12 percent per year. On average, there were 2,145 permits issued per year in the Fajardo/Ceiba Region between 1998 and 2003. A sharp increase in permits occurred in 2001 and 2002, with each year seeing more than 3,000 permits issued. Roughly half of the units authorized during the six-year period were in Rio Grande and Humacao, while Loiza experienced fewer than 100 authorized units per year. A total of 420 building permits were issued in Fajardo and Ceiba in 1998, which decreased to 263 and 260 in 1999 and 2000, respectively. Activity then rebounded with 549 permits issued in 2001, 501 in 2002, and 413 in 2003.

Exhibit 9 examines demand for additional housing units based on future population growth, as projected by the Puerto Rico Planning Board. The greatest demand for new housing was expected in 2000 through 2005, with 42,000 new units needed to keep up with population growth. Population growth is projected to taper off in the second half of the next decade, slowing demand for new housing. By 2025, the Fajardo/Ceiba Region is projected to require about 13,000 additional housing units to accommodate 38,000 new residents.

New Projects in the Fajardo/Ceiba Region

There are several residential developments currently selling in Fajardo, primarily targeting San Juan professionals seeking second homes. As shown in Table A.10 below, strong monthly absorption rates and steadily increasing prices typify the market. Product types include single-family homes, such as those at Puertas del Sol and La Costa Garden Homes, and attached condominiums/ townhomes at Castillos del Mar, Costa Brava, and La Costa Walkups.

Table A.10
Projects Currently Selling in Fajardo/Ceiba, February 2004

Project/Location	Total Units	Bedrooms/Bathrooms	Unit Size (Square Foot)	Recent Price Range	Price Per Square Foot	Overall Monthly Absorption
<i>La Costa Garden Homes</i>	109	<i>3 bd / 2.5 ba</i>	1,930	<i>\$175,000–\$195,000</i>	<i>\$91–\$101</i>	4.2 ¹
<i>La Costa Walk-ups</i>	144	<i>3 bd / 2 ba</i>	1,312	<i>\$170,000–\$211,000</i>	<i>\$130–\$161</i>	<i>n/a</i>
<i>Puertas del Sol</i>	96	<i>3 bd / 2 or 2.5 ba</i>	2,030–2,338	<i>\$225,000–\$265,000</i>	<i>\$111–\$113</i>	3.4
<i>Costa Brava (phase I)</i>	112	<i>3 bd / 2 ba</i>	1,077	<i>\$156,000–\$161,000</i>	<i>\$145–\$150</i>	4.0 ²
<i>Costa Brava (phase 2)</i>	90	<i>3 bd / 2 ba</i>	1,183	<i>\$137,000–\$180,000</i>	<i>\$116–\$152</i>	9.0 ³
<i>Castillos del Mar</i>	230	<i>3 bd / 2 ba</i>	1,376–1,423	<i>\$195,000–\$245,000</i>	<i>\$142–\$172</i>	12.5

Sources: Developers' Sales Staff; and CBRE Consulting.

1. In one year of release, 50 units were reserved with options. Construction will begin in April or May 2004.

2. Includes 48 completed sales and 61 options.

3. Released and sold all 90 units in three weeks.

Sources: Developers' sales staff, and CBRE Consulting.

Interviews with sales staff at several of the residential developments revealed the following:

- Sales staff at Castillos del Mar reported swift absorption of units, as 200 total units were sold between November 2002 and February 2004. Representing the most expensive condominiums in the market area, Castillos del Mar's units have ocean views and amenities including a security gate and two parking spaces per unit.
- Sales at Costa Brava's first phase were strong, with four units closing per month. The second phase experienced overwhelming speed in absorption, as the 90-unit phase sold out in three weeks, even though price points were higher than the first phase.
- The single-family home market experienced solid absorption at both projects surveyed, La Costa Garden Homes and Puertas del Sol. Puertas del Sol has averaged 3.4 unit sales per month during its two years on the market, and only 14 units remain unsold.

Case Study: Palmas Del Mar

The experience at Palmas Del Mar could serve as a case study for future potential residential development at Roosevelt Roads. Beginning construction in 1969, the master planned community was envisioned to include 9,000 total dwelling units on 2,700 acres. To date, approximately 3,500 units have been built. Absorption has averaged 140 to 150 new units and 20 to 30 resales per year in recent years. The owner-residents at Palmas Del Mar tend to be locals, with only 20 percent of buyers coming from the mainland, and about half consider Palmas Del Mar to be their primary residence.

Conclusions

Current residential market conditions in the Fajardo/Ceiba Region are depressed, with declining prices and increased vacancy, which are due primarily to the closure of Roosevelt Roads and the departure of associated military and civilian jobs. In the near term, Roosevelt Roads is not proximate to job centers, which will temper demand for housing. Since the Region will require 13,000 new housing units by 2025 to keep up with population growth, future demand for housing located at Roosevelt Roads could be strong, either for re-use of current housing or construction of new units, especially as jobs are attracted to Roosevelt Roads over time. The site attributes of Roosevelt Roads, including spectacular views and existing infrastructure including schools, hospital, etc., as well as the future improvements in access to San Juan via new highway construction, could make the site an attractive location for both the primary and second-home markets. However, it is anticipated that annual absorption of housing units at Roosevelt Roads would not surpass approximately 200 to 250 units per year based upon the future population growth in the area and the absorption experience at existing new developments in the market area.

The contents of this report are subject to the appended Assumptions and General Limiting Conditions.

ASSUMPTIONS AND GENERAL LIMITING CONDITIONS

CB Richard Ellis Consulting has made extensive efforts to confirm the accuracy and timeliness of the information contained in this study. Such information was compiled from a variety of sources, including interviews with government officials, review of City and County documents, and other third parties deemed to be reliable. Although CB Richard Ellis Consulting believes all information in this study is correct, it does not warrant the accuracy of such information and assumes no responsibility for inaccuracies in the information by third parties. We have no responsibility to update this report for events and circumstances occurring after the date of this report. Further, no guarantee is made as to the possible effect on development of present or future federal, state or local legislation, including any regarding environmental or ecological matters.

The accompanying projections and analyses are based on estimates and assumptions developed in connection with the study. In turn, these assumptions, and their relation

to the projections, were developed using currently available economic data and other relevant information. It is the nature of forecasting, however, that some assumptions may not materialize, and unanticipated events and circumstances may occur. Therefore, actual results achieved during the projection period will likely vary from the projections, and some of the variations may be material to the conclusions of the analysis.

Contractual obligations do not include access to or ownership transfer of any electronic data processing files, programs or models completed directly for or as by-products of this research effort, unless explicitly so agreed as part of the contract.

This report may not be used for any purpose other than that for which it is prepared. Neither all nor any part of the contents of this study shall be disseminated to the public through publication advertising media, public relations, news media, sales media, or any other public means of communication without prior written consent and approval of CB Richard Ellis Consulting.

Appendix A.b:

I. Environmental

Naval Station Roosevelt Roads, on mainland Puerto Rico, is approximately 8,600 acres in area. This area consists of military installations, residential regions, an airfield, wetlands and floodplains. Approximately 4,250 acres, or 53% of the total area, consists of mangroves, seagrass beds, natural animal habitats and other environmentally sensitive areas as shown on Figure 1. Mangrove forests provide protected nurseries for fishes, crustacean and shellfish and provide food for a multitude of marine species. Their branches provide nesting areas for birds. The seagrass beds and coral reefs provide a habitat for the West Indian Manatee, which is an endangered species. The site also has approximately 150 storage tanks, both above and below ground, which store various types of oil. Due to these factors, environmental considerations need to be well thought-out in developing a reuse plan. A detailed assessment of the environmental considerations is outside the scope of this report. Outlined below is a summary of known information on environmental conditions based on previously performed assessments and reports.

Permits & Documented Information

Wastewater

The base has three wastewater treatment plants on site, the 0.65 MGD Bundy Sewage Treatment Plant, the 1.1 MGD Capehart Treatment Plant and the 1.0 MGD Forrestal Sewage Treatment Plant.

A National Pollution Discharge Elimination System (NPDES) permit is required to operate the wastewater treatment plants. Currently one permit covers all wastewater systems throughout the site. Separate permits would be required if the base were divided, i.e. owned/operated by more than one entity. The permit process could take several years. Turning the treatment plants over to the Puerto Rico Aqueduct and Sewer Authority (PRASA) may alleviate the need for separate permits.

NFEC ECP Report
April 2004 Fig 2-8

Underground Storage Tanks and Aboveground Storage Tanks

Naval Station Roosevelt Roads contains approximately 150 aboveground and underground storage tanks which store various types of oil ranging from jet fuel to diesel. The majority of tanks at Roosevelt Roads require a Spill Prevention Control and Countermeasures (SPCC) Plan. The SPCC plan covers only oil, not hazardous waste. An SPCC plan addresses the issue of spill prevention, response actions, and containment. The SPCC plan is a specific report developed for a particular site under the guidelines of the Code of Federal Regulations, 40 CFR 112. This particular code covers all ASTs, subterranean vaulted tanks and bunkered tanks. (Baker 2003)

A facility requires an SPCC plan if the following two criteria are BOTH met: the spill can reasonably be expected to reach navigable waters and storage capacity exceeds 1320 gallons in all containers greater than 55 gallons. Since the site is more analogous to a multi-facility town than a single facility industrial plant, the whole site is covered by one plan. (Baker 2003) This may change if the site is divided among different owners/operators.

The SPCC Plan for Roosevelt Roads was prepared in January 2003. The SPCC Plan covers needed repairs, installations, upgrades, inspections (daily/weekly/monthly/annually), etc. required for tanks, loading/unloading areas, oil water separators, etc. to be compliant with governing regulations. The report is very detailed with regard to the above. The report divides Roosevelt Roads into smaller areas (Airfield, Atlantic Facility Weapons Training Facility (AFWTF), Fuel Division, Public Works, etc) and lists the tanks covered in each area, deficiencies, required repairs and required inspections. The report also includes some preliminary cost estimates for items required to be installed/repaired, if tanks are to remain in service. If the tanks will be removed from service, it must be done in accordance with Puerto Rico Environmental Quality Board requirements. The SPCC report also includes a log of reported spills at NSRR. (Baker 2003)

A SPCC Corrective Action Plan also exists which was prepared by CAPE Environmental Management. It is an action plan to correct deficiencies outlined in the SPCC Plan. CAPE

was awarded a delivery order to perform upgrades on selected USTs and ASTs (18 USTs and 35 ASTs). The Public Works Department has informed that the work contained in this report has been completed.

A Phase I Environmental Condition of Property Report was prepared by the Navy in March 2004 in anticipation of the closure of the base and subsequent transfer of the property. This document is a survey of the existing environmental conditions at Roosevelt Roads. The report is based on the results of investigations, interviews with persons familiar with NSRR and a review of available information and data.

An Area of Concern (AOC) is an area identified for possible contamination. If confirmation of contamination is obtained, the area becomes a Solid Waste Management Unit (SWMU). A process is currently in place for identifying and designating SWMUs and AOCs. The handling and disposal of waste products associated with SWMUs is regulated by the Resource Conservation and Recovery Act (RCRA) under the Hazardous and Solid Waste Amendments (HSWA). If any SWMU or AOC is suspected to be a source of a contaminant, the owner or operator of the facility is required to perform a RCRA Facility Investigation (RFI) to define the nature and extent of the release. (USEPA 1994) Under these guidelines, the Navy is responsible for the cleanup and remediation of these sites and as such contracts disposal work to contractors. RFI Phase I activities are limited to sampling and analysis of environmental media. Pending the results of Phase I, a full RFI may be required. A full RFI is performed to determine the nature, rate, direction and extent of hazardous waste.

The USEPA Region II has issued a Part B Permit to NSRR. A Part B Permit is required for any facility that currently or plans to treat, store or dispose of hazardous waste and is governed by the guidelines of RCRA. The permit contains a list for RFI activities at 24 SWMUs and 3 AOCs at Naval Station Roosevelt Roads. These areas consist of reported fuel leaks, solid waste landfills, hazardous material spills, chemical spills,

PCBs and metal deposits. The list includes such RFI activities as soil sampling, ground water sampling, and surface water sampling. The list also outlines whether Phase I only or Full RFI are required for each SWMU. Examples of SWMU's outlined in the Permit are the 159 acre landfill (SWMU #3), an out-of-service power plant located on Cabras de Tierra (SWMU #11) and a plume resulting from a fuel tank leak (SWMU # 7 and #8), which has been contained below the fuel farm.

Baker Environmental prepared a report entitled Final Data Collection Quality Assurance Plan which lists the required sampling and analyses for the RFI at NSRR. It also includes permit requirements, SWMU/AOC status, data collection strategy and requirements, field investigations, etc. The report includes procedures to be followed for soil borings, test wells and rock cores. etc. Baker Environmental and CH2MHILL were contracted to prepare RFI reports for Naval Station Roosevelt Roads. These consultants prepared RCRA Facility Investigation reports for Phase I and Phase II, respectively. The Phase II report covers only SWMU #30, which is an incinerator, formerly used to burn contaminated fuels, waste oils and sludge. These reports include detailed information on existing conditions and background information for the sites in question. The reports include recommendations for any further action to be taken. Under the regulations of the Part B Permit, once an RFI is complete, a Corrective Measures (CM) plan is to be developed by the permittee to remediate the site. The CM is to be approved by the USEPA. (BakerRFI 2000, CH2MHILL 2000)

Stormwater The Navy currently maintains a storm water discharge permit, which is fully transferable.

The landfill located at the end of Forrestal Drive is the only one in this area of Puerto Rico. The permit to operate the landfill is scheduled to expire in August 2004. According to Public Works personnel, the Navy has no plans to renew the permit. If there is a need to keep the permit open, notice should be given to the Navy and Department of Public Works.

Landfill

According to the Public Works Department, all sandy beaches along the shoreline of the base are protected turtle nesting areas. Currently the only declared critical habitat is that of the Yellow Shouldered Blackbird. Mangroves are considered the most important habitat for the Yellow Shouldered Blackbird. Other species of consideration are the Puerto Rican Boa and the West Indian Manatee.

Wildlife Habitat

The Integrated Natural Resources Management Plan, prepared by Geomarine in April 1998, details some of the ecological considerations for Roosevelt Roads and how best to protect them. The plan covers 10 years from 1998-2007 but is reviewed annually and will be reapproved after five years. The plan is an ecosystem based plan for management of fish, wildlife, forest, coastal resources and land. The report covers NSRR, Isla Pineros, Cabeza de Perro, Pico de Este, Crown Mountain, St. Thomas, Spratt Hall, St. George Hill and St. Croix. A separate report was developed for Vieques in July 1996. The report recommends obtaining a US Army Corp of Engineers approved delineation of all wetlands areas for identification and protection of threatened and endangered plant and animal species. There are also recommendations for maintenance of protected areas and associated cost estimates. The report also recommends hiring a full time manager to implement the plan and requires that the position of Fish and Wildlife Conservationist be funded and filled. (Geomarine 1998)

Appendix A.b:

II. Transportation

Regional Transportation Systems

Roadways, Bus, Ferry

NSRR is easily accessible via both PR-3, a two lane highway, and PR-52, a four lane highway. There are three gates which access the main base: Gate 1 at the north end of the base, Gate 3, which is south of the airfield at the intersection of PR-3 and PR-52, and Gate 4, a third entry point further south which accesses the Bundy area. Gate 1 is located at the intersection of Tarawa Drive and Boxer Drive and is accessed via Tarawa Drive via PR-3. From Gate 1, it is approximately 5 miles to Fajardo and 42 miles to San Juan. Gate 3 is located at the east end of Bennington Road, which can be accessed by both PR-3 and PR-52. The gate which accesses Bundy is located at the west end of Bennington Road. A fourth access point (Gate 2) services the airfield from PR-3. This access point is located between Gate 1 and Gate 3.

The majority of the roads on the base are two lanes wide and paved. In most areas there are no curbs and gutters. A review of records at the Public Works building revealed that the existing pavement section consists of an 8-inch thick base course with a 2 to 4-inch thick asphalt top course. Some areas have been overlaid throughout the years. A preliminary investigation showed that most of the road surfaces are in fair to good condition with a considerable amount of serviceable life remaining, depending on the projected uses and traffic conditions/ loadings.

Puerto Rico is without islandwide city-to-city bus and rail service. However, públicos (part-bus, part-taxi) vehicles are an inexpensive way to traverse the island. Públicos transport up to ten people over somewhat flexible routes and distances Monday through Saturday. Each city has its own terminal. Few have phone service; to get a schedule one must visit the terminal.

The ferry service in San Juan is owned and operated by the Puerto Rico Port Authority (PRPA). Passengers can take a ferry from the tourist dock in San Juan to Fajardo, Vieques, Catano, Old San Juan and Mayaguez. Ferry service also exists from Fajardo to Vieques and Fajardo to Culebra. The PRPA has expressed interest in relocating the Fajardo-Vieques ferry from Fajardo to NSRR.

Figure B.4
*Aerial View of
Naval Station
Roosevelt Roads*

Airport The airfield at Roosevelt Roads has several runways, the longest of which is 11,000 feet. Based on information obtained on Boeing's website, a jumbo 747 jet should be able to land on a runway of this length.

The information obtained from the Navy base map for 2004 indicates Air Installation Compatibility Use Zone (AICUZ) designations to show the restrictions for building around the airfield. The categories listed on this base map are as follows: clear zone, primary surface, APZ I, with noise restrictions and APZ II with noise restrictions. The clear zone is a 3000 foot by 3000 foot area closest to the end of the runway. This is the most hazardous area outside the runway. The primary surface corresponds to the landing surface. The areas designated APZ are Accident Potential Zones. These are the areas with the greatest potential for planes to crash. APZ I areas are 3000 feet wide by 5000 feet long while APZ II areas are 3000 feet wide by 7000 feet long. Constructing in these areas is highly limited due to the hazard. In the APZ I area, residential construction is forbidden, transportation and utilities can be built in the area, and select service industries, manufacturing plants, cultural/entertainment industries, and resource production can occur in this area. The APZ II area allows a wider range of construction because it is a lower hazard area.

The noise zones in the AICUZ refer to the following: Zone I, 65–70 dB, Zone II, 70–75 dB, Zone III, 75–80 dB, Zone IV, 80+ dB. These contours are developed based on the Day-Night Average Sound Level which is used for all of the United States except California. Table B.1 is a general list of building restrictions for all four zones. However, for each specific use, the code needs to be interpreted.

Generalized Land Use	Zone I 65–70 dB	Zone II 70–75 dB	Zone III 75–80 dB	Zone IV 80+ dB
<i>Residential</i>	No	No	No	No
<i>Manufacturing</i>	<i>Yes</i>	<i>Yes</i>	<i>Yes</i>	<i>Yes</i>
<i>Transportation, Communications, Utilities</i>	<i>Yes</i>	<i>Yes</i>	<i>Yes</i>	No
<i>Trade, Business, Offices</i>	<i>Yes</i>	<i>Yes</i>	<i>Yes</i>	No
<i>Shopping Districts</i>	<i>Yes</i>	<i>Yes</i>	<i>Yes</i>	No
<i>Public, Quasi-Public Services</i>	No	No	No	No
<i>Recreation</i>	<i>Yes</i>	<i>Yes</i>	No	No
<i>Public Assembly</i>	No	No	No	No
<i>Agriculture & Mining</i>	<i>Yes</i>	<i>Yes</i>	<i>Yes</i>	<i>Yes</i>

Table B.1
Compatibility Land
Use for AICUZ
Noise Zones

There is a restriction on building heights in and around the airfield. These restrictions are regulated by the Federal Aviation Administration under 14 CFR Part 77. If the airfield is to remain active, this code will govern the heights of new construction.

Marine Naval Station Roosevelt Roads is constructed around the perimeter of Ensenada Honda. Ensenada Honda is approximately 1 to 1 ½ miles wide and 2 miles long. Along the East side of the harbor are 4 piers (Fuel Mooring Pier, Pier 1, Pier 2 and Pier 3) with varying alongside depths of 32–44 feet. Between these piers are several bulk-heads which provide additional moorings with depths of approximately 15 feet. Located in Ensenada Honda to the West of the fuel mooring pier is a small craft marina.

Figure B.4
Ensenada
Honda

Bahia de Puerca lies approximately 1 mile Northeast of Ensenada Honda. This bay is approximately ½ mile wide and ¾ mile long with depths of 37 feet or more. A dry dock facility is located inshore on Bahia de Puerca. The dry dock is located off Barnes Street at the eastern end of the base, just South of Punta Puerca. The dry dock was visited in October 2003 by the team and was observed to be in need of repair as it was clear that it has not been maintained.

Ensenada Honda is serviced by a 1000 foot wide, 40 foot deep navigation channel which passes between Cabra de Tierra and Punta Cascajo. The channel is oriented south-east-northwest. The harbor is somewhat sheltered from sea and swell by the partial encircling of shore and reefs.

Customs Pier

The customs pier is a 184 feet long by 35 feet wide pier.

Figure B.5
Customs Pier

Dry Dock Facility

The dry dock facility consists of a 140 foot wide by 1100+ foot long slip that was once maintained to a depth of at least 40 feet. A 27-foot wide by 670-foot long pier extends from the north end of the dry dock into Bahia de Puerca. The pier is in poor condition. The water depth at the pier is 40 feet, based on a National Oceanographic and Atmospheric Administration (NOAA) nautical chart.

Figure B.6
Dry Dock

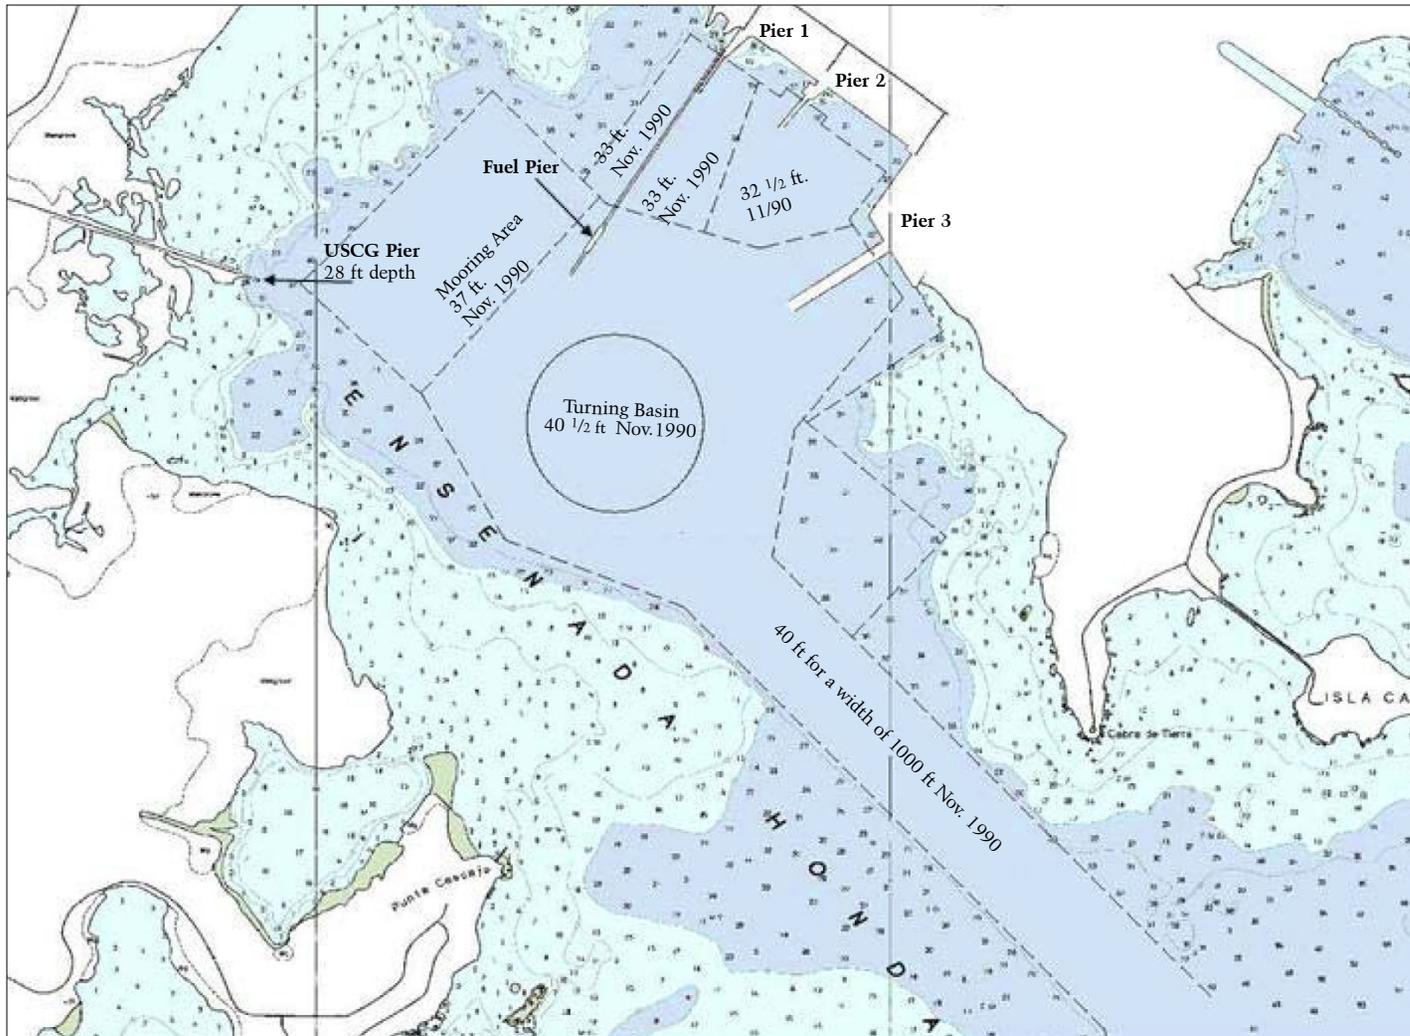

Figure B.7
Bathymetric Chart

Figure B.8
*Fuel Pier: Fueling
 Stations in
 Background*

Fuel Mooring Pier

The Fuel Mooring Pier extends 2650 feet into Ensenada Honda. The pier consists of a concrete deck supported by square concrete piles, housing a fueling platform with two berths—Berth 1 on the east side and Berth 2 on the west side. The pier has 6 loading stations, each equipped with two fuel stations (diesel and JP-5) and a potable water connection. Monitoring wells are in place along the North side of the fuel pier. Three of the loading stations have a 4" sanitary sewer connection. The middle loading station on Berth 1 is equipped with three telephone connections. The water depth at the fuel pier is currently maintained at 40 feet. The pier is approximately 15 years old, appears to be well maintained and in good overall condition.

Figure B.9
*Pier 1
 (Fuel Mooring Pier in
 Background)*

Pier 1

Pier 1 is located adjacent to the fuel pier. The overall length of Pier 1 is approximately 448 feet and its width is 34 feet. The concrete deck pier is supported by square concrete piles and continuous bent caps with concrete encased steel beams spanning between bent caps. The pier offers water service, F44/ JP5 fuel and a water depth of 36 feet. The pier is approximately 50 years old and appears to have existed without any significant repair work being performed. The pier's close proximity to the fuel pier, approximately 20 feet, renders its west side inoperable for berthing. Fuel lines run along its east side for the entire length of the pier. A preliminary inspection of the underside of the pier from the vantage point of the adjacent rip-rap revealed a significant amount of deterioration. Spalled concrete was observed along the bent caps and the underside of the deck. Exposed reinforcing steel and steel beams were observed to be corroded. A damaged protection dolphin was observed along the southwest corner of the pier. Debris was observed between pier 1 and the fuel pier.

Figure B.10
Pier 2

Pier 2

Pier 2 is a 400-foot long by 38-foot wide concrete deck, concrete pile supported structure, with 38-foot water depth. There are two berths along Pier 2 and each one is serviced by four phone connections, sanitary sewer, water and electrical connections. The fender system consists of battered timber piles connected to horizontal timber sections connected to the pier deck via trapezoidal rubber fenders. Foam filled fenders are installed toward the waterside end of the pier. The bollards along the pier are seated and bolted to large concrete slabs. The connecting bolts have rusted/ corroded. The limited view of the pier's support system revealed both plumb and battered square concrete piles, which appeared to be in sound condition. The pier is approximately 50 years old.

Figure B.11
Pier 3

Pier 3

Pier 3 is a 1200-foot long by 120-foot wide structure with two berths, one on either side, built in the early 1960s. The alongside depth is approximately 40 feet on the North side of the pier and 44 feet on the South side. The pier has an approximate elevation of +10 MLW. One light tower stands at each end of the pier. The pier consists of 14 fueling stations. Services at the fueling stations include F-44/ JP5 fuel by tanker truck, diesel, potable water, sanitary sewer, telephone and electrical. The utilities are housed in chases on either side of the pier. The pier is supported by steel H piles and precast concrete piles with individual pile caps. The fender system consists of 1H:12V battered timber piles with horizontal timber wales along the side of the pier and 12-foot long foam filled fenders. The timber system has been damaged in some locations. This fender system was repaired during the mid-90s.

Figure B.12
LST Ramp and
Bulkhead C

Bulkheads @ Landing Ship Tank (LST) Ramp

The bulkhead system in the vicinity of the piers consists of Bulkhead A (823 feet), Bulkhead B (1000 feet), Bulkhead C (800 feet) and Bulkhead D (300 feet—west of Pier 3, 340 feet—east of Pier 3). The bulkheads are approximately 20 to 30 years old. Bulkhead A stretches from Pier 1 to Pier 2, Bulkhead B from pier 2 to the LST ramp, Bulkhead C runs from the LST ramp south to Bulkhead D and Bulkhead D runs east-west extending out from pier 3. The Bulkhead construction is steel sheet pile with concrete cap. All visible sheet piling is showing signs of rust and corrosion. Diagonal rubber fenders are fixed to the concrete cap. The bulkheads are equipped with sanitary sewer, potable water and electric services in some areas. The water depth is 10 feet at Bulkhead A, 15 feet at bulkhead B, C and D. Bulkhead D is the primary berth for Atlantic Fleet Weapons Training Facility AFWTF vessels. An LST ramp is located at the corner of Bulkhead B and Bulkhead C. The ramp is approximately 75 feet wide and extends into the water reaching an elevation of -1.0 MLW. The surface of the ramp was in fair to good condition with some surface cracking.

Figure B.13
Marina

Marina

The small craft marina is located off of Towaway Drive on the west side of the fuel-mooring pier. The facility was constructed during the late 1990s and consists of 72 boat slips and 25 moorings. Each boat slip is approximately 12-foot wide. In general, each set of two slips is bordered by two 3-foot wide finger piers and the steel sheet pile bulkhead retaining system. A three-foot wide concrete cap sits atop the steel sheeting. Rubber diagonal fenders are attached to the finger piers. A single pile at the waterside end of each set of slips marks the division between the two slips. A ship service box is located on the sidewalk at the center of each pair of slips. Each box provides potable water and 110 V power. Conduit has been placed for cable television but cables were never installed. The average depth at the seawall is approximately 6–8 feet. The facility is generally in good condition as it is relatively new. There is some cracking along the sidewalk and seawall cap.

Appendix A.b:

III. Infrastructure

Potable *Description of Components*

Water

Naval Station Roosevelt Roads' raw water supply is obtained from the Rio Blanco River within the rainforest of the Sierra de Luquillo mountains of El Yunque as shown in Figure 3. Rainfall is collected in the Rio Blanco River where raw water is drawn from two intake points to supply NSRR. One is near the Rio Blanco hydroelectric plant, the other is from the hydroelectric plant's outfall. The intakes are well located and quality of the raw water is very good (Baker/Weston 1993). Reliability of the source is subject to the flow fluctuations of the Rio Blanco River and the strength of arrangements with the Puerto Rico Authority of Electric Energy that operates the hydroelectric plant.

Raw water is transported from the intakes through a reinforced concrete grit chamber. At this point the water is at approximate elevation 95 feet above mean sea level (MSL). Degritted water flows by gravity through an 11 mile, 27-inch, reinforced concrete pipe (RCP), to the 43.6 million-gallon reservoir, which is at approximate elevation 47 feet MSL. Average raw water withdrawn from the river over a nine (9) month period is 1,011,555 gallons per day. The raw water is converted to potable water by treatment on site at Water Treatment Plant 88. According to NSRR Public Works Department, local residents have been tapping into the 27" RCP at points upstream of the reservoir and filtration plant. The water upstream of the filtration plant is still in a raw, untreated state. These casual connections also provide inlets for contamination to the water supply since there are no backflow preventers installed. Letters have been sent to the local authorities, advising that this water has not been treated and is unsuitable for consumption. (Baker/Weston 1993, G&FTDPW 2002)

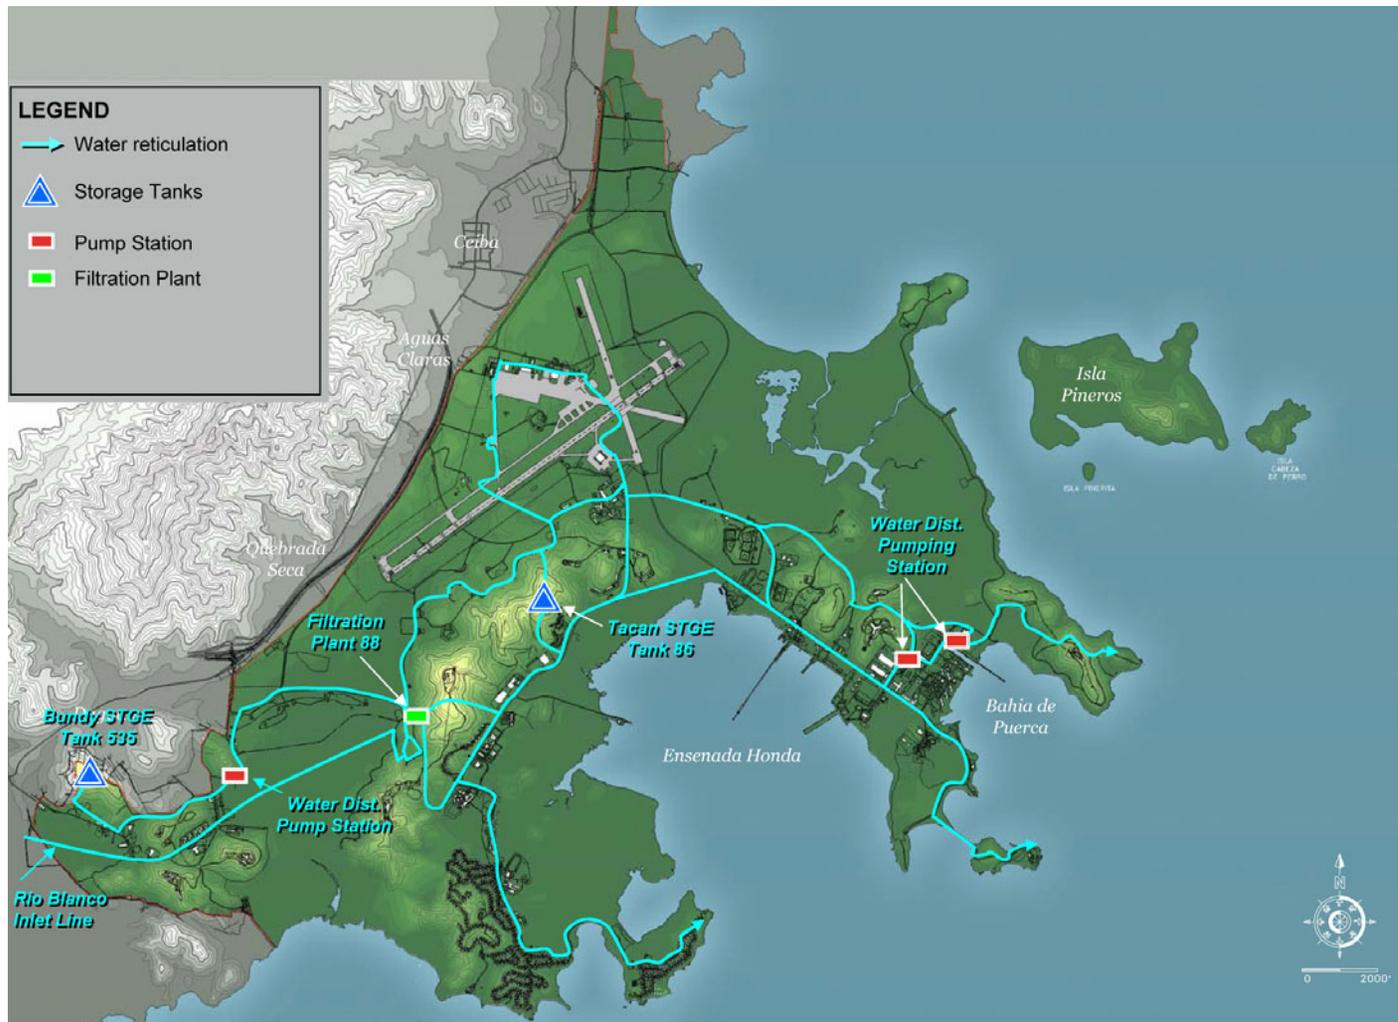

Figure B.14
 Water Distribution
 System for
 Roosevelt Roads

Sources:
 NSRR Jan 2004
 Water Distribution Dwg

The potable water distribution system inside the base consists of approximately 64.4 miles of distribution piping up to 18 inches in diameter, 7 pump stations, and 5 ground storage tanks. The original distribution system was installed in the 1940s. Pipe materials include approximately less than 1% copper pipe, less than 1% ductile iron pipe (DI), 1% galvanized steel pipe (Galv), 6% cast iron pipe (CI), 76% polyvinyl chloride pipe (PVC), and 17% unknown materials. The water system is a combined potable and fire protection system. There are 179 hydrants within the system. Distribution system pressures are unknown.

Raw Water Reservoir: The raw water reservoir provides 10 days of emergency reserve during design flow and 25 days of reserve during average flow (Baker/Weston 1993). It has a 5.6 acre surface area with a 30-foot design depth. The reservoir is a reinforced concrete lined basin with a distribution inlet, an overflow and a discharge structure incorporating two discharge pipes. The reservoir inlet is a 24 inch diameter cast iron pipe. The reservoir overflow is a broad-crested concrete weir that drains to a paved concrete ditch surrounding the reservoir. There is a 16 inch discharge pipe that may be used to drain the reservoir and allow sediment to discharge into the concrete paved ditch. The three drainage valves which control this discharge pipe were noted in a September 1993 inspection to be inoperable. This allows sediment to build up in the reservoir. Fine river sediments carried with the water from the Rio Blanco settle to the bottom of the reservoir. Sediments accumulated in the reservoir were found to be approximately 2 feet thick, which has reduced the capacity of the reservoir. (Baker/ Weston 1993)

The 24 inch discharge main extends to the Treatment Plant Building 88 where two raw water booster pumps are located. The booster pumps are provided for the purpose of moving water from the raw water reservoir to the treatment plant in the event that water levels in the reservoir are below the operating level in the plant. The two booster pumps are 12 inch, split case, double suction, horizontal centrifugal type pumps. The water flows either by gravity or is discharged by the booster pumps into the flash mixing basin. (Baker/ Weston 1993, G&FTDPW 2002)

Water can also be withdrawn from below the surface through either of two gate valves located at elevations 35.5 and 18.7 feet.

Water Treatment Plant 88: Water Treatment Plant 88 is located on Langley Drive, North of the Raw Water Reservoir. It is a conventional sand filtration type water treatment plant and was constructed in 1942. The raw water source is the Rio Blanco River. The permitted capacity is unknown. The average daily flow is 1,000,000 gallons per day (gpd) and the maximum daily flow is 4,000,000 gpd. The water treatment plant is operated by an operations and maintenance company under contract to the Navy. (G&FTDPW 2002)

Raw water enters the treatment plant from the raw water reservoir to the South of the plant. As the flow is sent to the flash mix basin, chlorine is added to minimize biological activity. The flow next passes to the coagulation basins where flocculation occurs. Flocculated water exits the coagulation basins through two 30 inch wide stop plates and enters a series of channels and openings which distribute flow uniformly across the sedimentation tank. At the sedimentation basins, lime can be added. From the sedimentation basins, flow passes to the rapid sand filters. The rapid sand filters remove any floc from the water flow which was not removed in the sedimentation basin. Settled water exits the sedimentation basin effluent channel through a 24 inch diameter main located at the channel midpoint. The main transports flow to the filter distribution channel which in turn brings water to each of the four multimedia rapid sand filters. Since the particulate matter is filtered by the sand, the sand needs to be washed out periodically to prevent problems with mud balls, bed cracking or sand incrustation. The water that washes out the filters is known as backwash, which is diverted back through the rapid sand filter for refiltering. After the rapid sand filters, fluoride is added. Flow then passes to the clear well where chlorine is added for disinfection. The existing chlorine contact tank is a nominal 120,000 gallon rectangular buried tank. It is approximately

56 feet long and 25 feet wide and is baffled. Filtered water enters the clearwell in the lower right corner of the tank. Lastly, flow is pumped by the finished water pumps to the distribution system. (Baker/ Weston 1993, G&FTDPW 2002)

The current alum feed system consists of a 2,500 gallon bulk storage tank, two metering pumps, associated piping and valves and a submerged alum feed pipe located at the rapid mix basin. The lime feed system consists of a dry lime feeder, solution tank and aboveground gravity feed lines to the rapid mix basin and to the final cell of the sedimentation basin. The water filtration plant uses gaseous chlorine stored on site in 1 ton cylinders. Chlorinators are located in the chlorine feed room in the control building. Two chlorinators are used. One doses chlorine to the 20 inch diameter raw water feed line, while the other is used to dose chlorine into the clearwell. (Baker/ Weston 1993)

Two sludge lagoons were constructed for the purpose of capturing and thickening solids generated during the treatment process. Solids can be stored in the lagoon until they can be conveniently removed for ultimate disposal. During normal operations, solids are discharged to one of the two lagoons and allowed to settle out. The supernatant from the lagoon is decanted back to the head of the plant for reuse. A decant structure equipped with a variable position slide gate is located in each lagoon. This structure allows a maximum solids storage level elevation of 11 feet and a maximum liquid level elevation of 17 feet. These operating levels allow approximately 1 foot of freeboard at the maximum liquid level. The sludge lagoons are 115 feet by 175 feet wide at the top elevation. The sides of each lagoon are sloped at a pitch of 2.5 to 1, resulting in bottom dimensions of 50 feet wide by 110 feet long. Each lagoon will hold an estimated 1 million gallons of waste. (Baker/ Weston 1993)

Water Pump Stations: The potable water system consists of 7 pump stations. There are a total of 17 pumps located within the 7 pump stations. Of these 17 pumps, 5 are fire pumps, 3 are jockey pumps and 9 are potable water pumps. The potable water pump stations are shown on Figure 3. The fire pumps range in capacity from 600 gpm to 2,000 gpm with heads ranging from 106 feet to 231 feet. The jockey pumps range in capacity from 22 gpm to 90 gpm with heads ranging from 116 feet to 285 feet. The potable water pumps range in capacity from 22 gpm to 1,500 gpm with heads ranging from 150 feet to 252 feet. All of the pumps are centrifugal pumps. All but one pump is powered with electricity. Fire pump #1 is a diesel powered pump. Fire pump #1 is located at pump station 460, which has a 500 gallon concrete diesel storage tank.

Water Tanks: There are five (5) water tanks located on the site. Of the five, four are constructed of concrete and one is steel. Potable water tank 86 is located on Gulf Road, east of Building 784. This tank is an aboveground potable water tank with a storage volume of 1,500,000 gallons. The tank is a 128 feet by 94 feet rectangular, concrete tank that is 20 feet tall.

Fire protection tank 459 is located on Tarawa Drive, next to pump station 460. This tank is an aboveground fire protection tank with a storage volume of 400,000 gallons. The tank is 46 feet in diameter, 32 feet tall and constructed of steel.

Potable water tank 535 is located on top of the hill at the end of Esperance Road. This tank is an underground potable water tank with a storage capacity of 750,000 gallons. The tank is a 84 feet by 63 feet rectangular, concrete tank that is 19 feet tall.

Fire protection tank 771 is located on South Delicias Road, east of Building 2296. This tank is an aboveground fire protection tank with a storage volume of 120,000 gallons. The tank is a 45 feet by 32 feet rectangular, concrete tank that is 11 feet tall.

Fire protection tank 2304 is located North of Building 786 at the Telemetry Site. This tank is an aboveground fire protection tank with a storage capacity of 20,000 gallons. The tank is rectangular and made of concrete and is 6 feet tall. (G&FTDPW 2002)

Conditions Assessment

The Technical Data Package (TDP) prepared by Gannett Fleming in June 2002 assesses the condition of the potable water system components (i.e. piping, tanks, water treatment plant).

The TDP uses a rating system to classify the condition of the components. The TDP indicates that the overall condition ratings were assigned based on visual observations, personnel interviews, available records and reports. The rating system has three categories: good, fair, poor. These categories are defined by the following:

- *Good*

1. The component is performing its intended function adequately.
2. The overall appearance is without defects.
3. No obvious deficiencies are evident.
4. Maintenance records are complete and up-to-date.
5. The component has at least 75% or a percentage up to 100% of its remaining useful life.

- *Fair*

1. The component periodically does not perform its intended function adequately.
2. The overall appearance is deteriorated.
3. Major items that make up the component are not functioning correctly or are deteriorated.
4. Evidence that maintenance is not occurring such as locks rusted closed, entrances rusted closed, incomplete or not up-to-date maintenance logs.
5. The component has 50% of its remaining useful life. (This criteria alone does not indicate a Fair rating.)

- *Poor*

1. The component consistently does not perform its intended function adequately.
2. The overall appearance is greatly deteriorated.
3. Major items that make up the component are not functioning at all or are greatly deteriorated.
4. Evidence that no maintenance is being performed.
5. The component has 25% or less of its remaining useful life. (This criteria alone does not indicate a Poor rating.)

The TDP yields a rating of good for all components of the potable water system. No deficiencies were identified.

Future Consideration

New legislation has been enacted under the Safe Drinking Water Act affecting drinking water systems. Specifically of concern at NSRR is the formation of volatile organic chemical contaminants called trihalomethanes (THMs). THMs are a group of compounds that have come under scrutiny in recent years as an important contaminant in drinking water. THMs are formed by the action of chlorine on certain naturally occurring organic chemicals in the raw water. Monitoring data for THMs at the discharge of the treatment plant and at remote points on the water distribution system show that the addition of chlorine for disinfection at the plant is causing the formation of this organic chemical contaminant at unacceptable concentrations. THMs may be controlled by various techniques, including enhanced treatment process control, removal of the precursor organic chemicals, elimination of chlorine as the disinfecting agent or removal of the fully formed THMs by physical or chemical treatment. This should be evaluated further with regard to regulations governing Roosevelt Roads. (Baker/ Weston 1993)

Domestic Wastewater *Description of Components*

Piping and Manholes: The wastewater collection system at Roosevelt Roads consists of approximately 32.5 miles of gravity lines, 9.5 miles of force mains, approximately 906 manholes, 28 pump stations and 6 grinder stations. The original collection system was installed in the 1940s with upgrades and new installations made in the 1990s. The gravity system pipe materials include less than 1% ductile iron (DI) pipe, less than 1% asbestos cement pipe, less than 1% concrete pipe, 44% polyvinyl chloride (PVC) pipe and 55% unknown materials. The gravity mains vary in size up to 24 inches. The force main system pipe materials include 7% DI, 81% PVC and 12% unknown materials. The force mains consist of pipe ranging in size up to 10 inches. The force main system was installed in the 1980s

and 1990s. The layout of the sanitary system is shown in Figure B.14.

Pump Stations: There are 28 wastewater pump stations throughout the base. These stations house pumps with capacities ranging from 100 to 1500 gpm, heads ranging from 10 to 124 feet and motors ranging from 1.5 to 50 horsepower. The pumps are mostly submersible with some wet pit type types. Appurtenances include diesel storage tanks, diesel generators, float pump control, radio telemetry and local alarms.

Wastewater Treatment Plants: Wastewater is collected and conveyed to one of three wastewater treatment plants on site for treatment and final disposal. Treated wastewater is discharged into the ocean. The average daily treated flow from the three plants was approximately 0.81 million gallons per day, when the base was active.

The base has three wastewater treatment plants on site. Bundy Treatment Plant is located at the Southern end of a dirt road at the intersection of Marqus Road, Rendova Street and Kwajalein Street. Capehart Treatment Plant is located at the Southern end of Intrepid Drive. Forrestal Treatment Plant is located on Forrestal Drive adjacent to Building 38. All three plants were originally constructed in the 1970s and all three were upgraded from secondary to tertiary treatment plants in 1996. With the exception of a cross over connection pump which is capable of diverting flow from Capehart to Bundy, each plant operates independently.

The Bundy and Forrestal treatment plants each consist of two primary tanks, trickling filters, denitrification system, a digester, drying beds, contact tanks, a grit remover and is equipped with a tertiary system and generator. Access to the Bundy plant is by way of a steep gravel and dirt trail, which becomes unnavigable during heavy storms. Access to Forrestal is via a paved road off of Forrestal Drive at the eastern end of the base. Capehart is located at the end of Intrepid Street, which is accessed via Lexington Drive. The

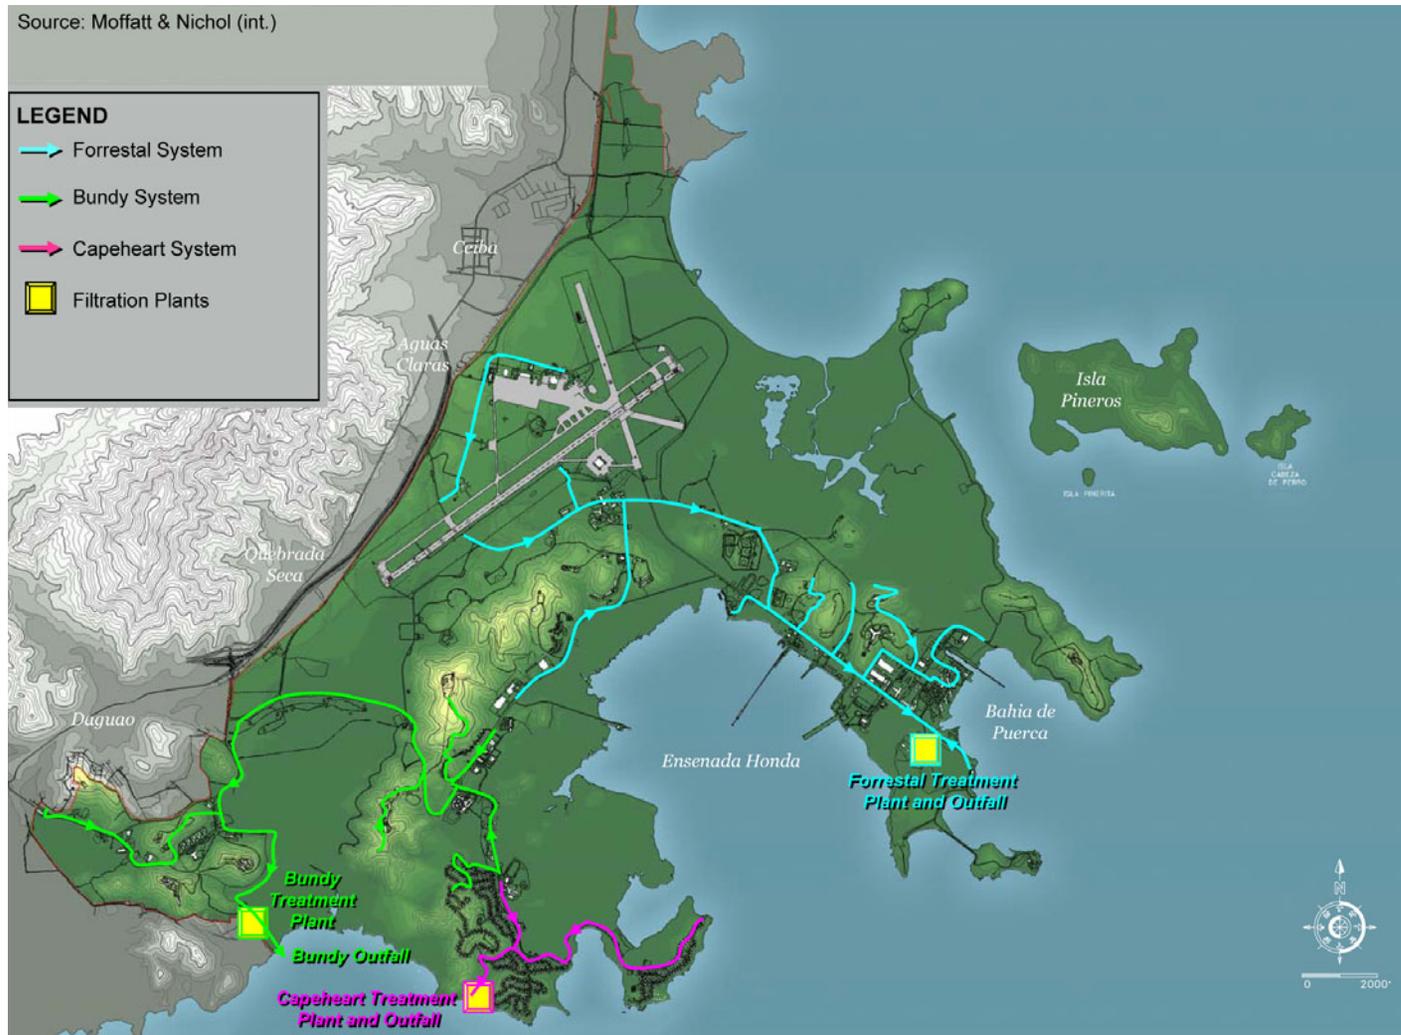

Figure B.15
Sanitary Sewer
Layout

Sources:
Moffatt & Nichol Int.

primary tanks at Bundy are in operation but the pits are overgrown with vegetation. The flow transmitter is inoperable at Bundy. The Capehart facility consists of two primary tanks, a denitrification system, a digester, drying beds, contact tanks, grit remover, an aeration tank with RAS system and is equipped with a tertiary system and generator.

Conditions Assessment

The Technical Data Package (TDP) prepared by Gannett Fleming in June 2002 assesses the condition of the sewage system components (i.e. piping, manholes, pump stations and wastewater treatment plants). The information contained in the TDP will be combined with more recent information received from Public Works Department to provide an outline of the condition of all components of the domestic wastewater system. The TDP rating system (good, fair, poor) used to classify the condition of the components is outlined previously in the potable water section. Refer to this section for ratings.

The TDP yields a rating of good for most components of the sewage system. Every component of the domestic wastewater collection piping and manholes was given a good rating in the TDP. All components of the domestic wastewater sump/grinder/ejector stations were given good ratings. No additional inspection information is available for these components of the sewage system.

All but two components of the domestic wastewater pump stations were given a good rating in the TDP. Facility number 2033 was given a fair rating and facility 2204 was given a poor rating. Information dated March 2004 from Public Works indicates several other pump stations with deficiencies, including eight inoperable pumps.

All domestic wastewater treatment plants were given good ratings in the TDP. Information from Public Works dated April 2003 indicates some components of the wastewater treatment plants were identified with deficiencies in operable components and maintenance items.

Future Considerations

The Base decommissioning, currently underway, will result in less solid waste production which will have a detrimental effect on the sewage treatment plants' ability to process wastewater. Without the production of solid

waste, the microorganisms that digest the organic materials will die off rendering the plants inoperable. The Navy's current plan is to maintain the treatment plants by supplying them with available wastewater flows as long as possible. Once they are no longer operable, the plants will be shut down and all equipment "moth-balled"—a process by which all equipment would be oiled, greased and bagged and thereby maintained. The Navy will operate and/or maintain the plants for the next two years. Serious consideration should be given to continuing to maintain these plants, as new permits will be required to restart the plants if any of the three is lost. According to Public Works, the permitting process can take up to eight years to complete. Minimum flow requirements to maintain the various plant operations were not available at the time of the site visit.

Stormwater runoff is collected via a system of drop inlets, drainage ditches, culverts and pipes and diverted to outfalls in the mangrove areas and the surrounding bays.

The electricity for the base is purchased from the Puerto Rico Electric Power Authority (PREPA). 38 KV is transferred to the site at two delivery points, "DAGUAO" (two 38 kV circuits) and a single 38 kV circuit at the Airfield. The 38 KV circuits serve eleven substations and those substations in turn serve loads in their vicinity at 13.2 KV, 4.16 KV, and 480 KV. Figure B.15 shows the 38 kV feeds to the substations. All loads on the distribution circuits can be fed from more than one substation (NSRR Public Works Department).

In 2001, it was estimated by Hayes, Seay, Mattern & Mattern, Inc. in their Final Technical Data Package (HSMM/2001) that maximum demand for the Daguaos Service was approximately 15,788 kVA and annual

Storm Drain & Retention

Electrical & Gas Services

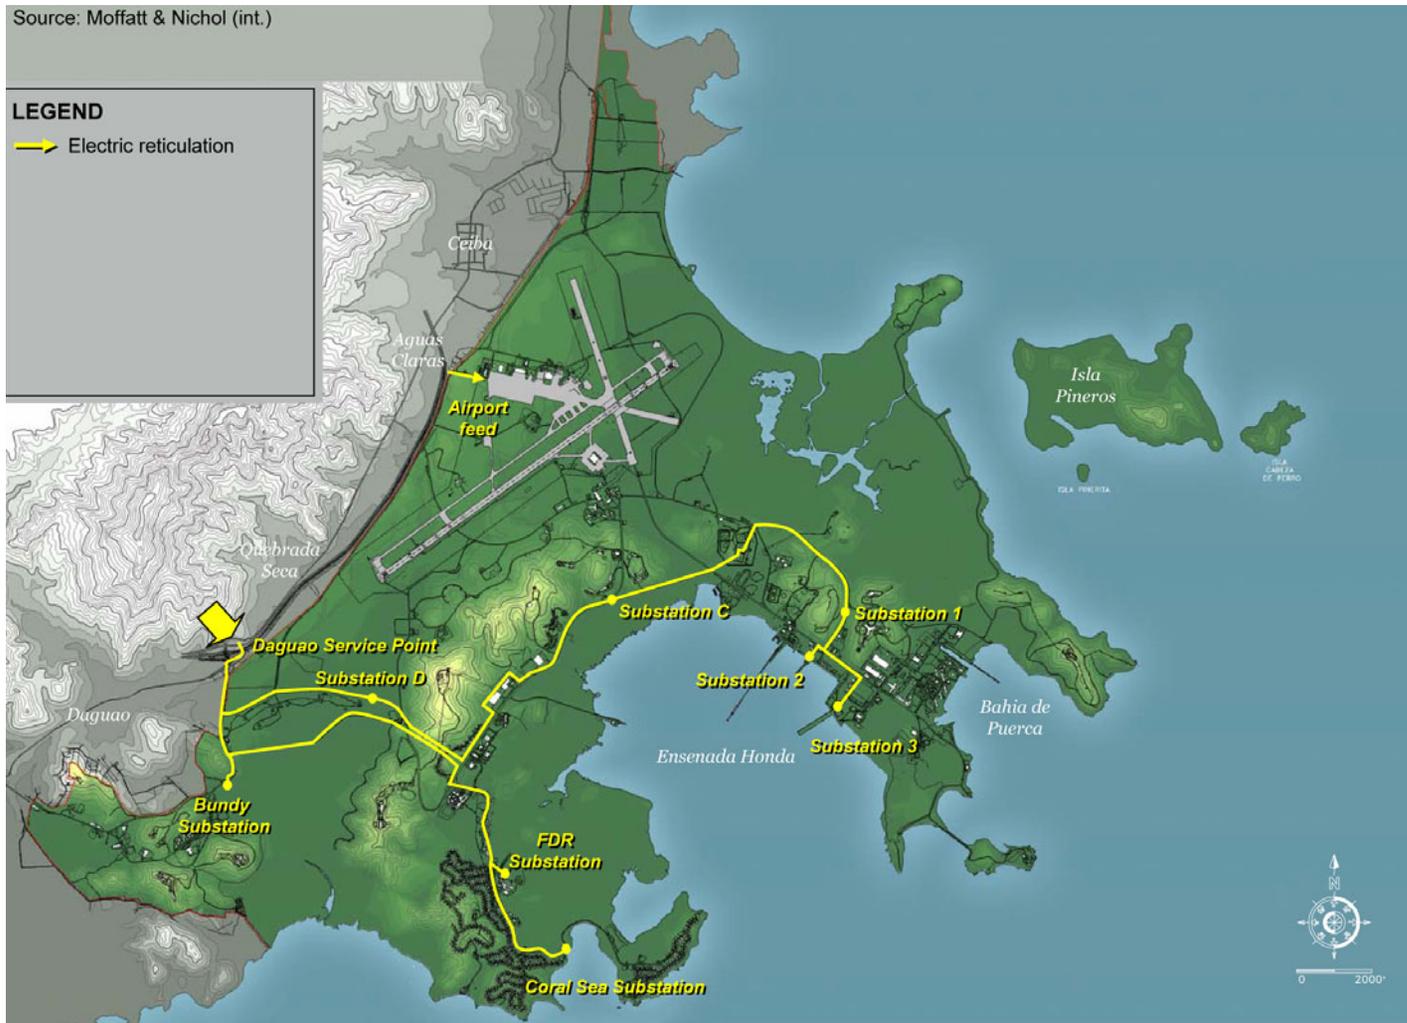

Figure B.16
 Primary Electrical
 Distribution
 System in
 Roosevelt Roads

Source:
 Moffatt & Nichol Int.

consumption was approximately 95,496 MWH. The other point of delivery is the Airfield Service, a single 38 kV circuit, located near the center of the eastern side of the base. Maximum demand for the Airfield Service was approximately 1,463 kVA and annual consumption was approximately 7,682 MWH. The two main points of entry service the substations listed in Table B.2.

Substation	Transformer Capacity (kV)	Primary Voltage (kV)	Secondary Voltage (kV)	Number of Circuits
<i>Substation C</i>	<i>6500</i>	<i>38</i>	<i>13.2</i>	<i>3</i>
<i>Substation D</i>	<i>5000</i>	<i>38</i>	<i>13.2</i>	<i>4</i>
<i>Substation T-492</i>	<i>750</i>	<i>38</i>	<i>0.48</i>	<i>3</i>
<i>Substation I</i>	<i>5000</i>	<i>38</i>	<i>13.2</i>	<i>2</i>
<i>Pier 2 Substation</i>	<i>2000</i>	<i>38</i>	<i>0.48</i>	<i>8</i>
<i>Pier 3 Substation</i>	<i>2500</i>	<i>38</i>	<i>0.48</i>	<i>24</i>
<i>Bundy Substation</i>	<i>3000</i>	<i>38</i>	<i>4.16</i>	<i>2</i>
<i>FDR Substation</i>	<i>5000</i>	<i>38</i>	<i>4.16</i>	<i>4</i>

Table B.2
Substations
Summary

The Daguao Service consists of two incoming 38 kV circuits from PREPA, Circuits 13800 and 5500. There is a meter at this service point. In most cases loads serviced at the 38 KV level are substation. There are three transformers serving individual buildings, which are served directly from the 38 kV circuits. Both of the 38 kV circuits utilize 46 kV rated insulators. 1/0 Cu Aerial conductors connect the Daguao Service to Bundy Substation and Substation D. Similarly Substation C is fed from Substation D and Substation I from Substation C. Coral Sea Substation is fed from FDR Substation which in turn is fed from Substation D also via 1/0 Cu Aerial conductors. The above noted construction is in fair condition. (HSMM/2001)

The airport service is a 38 kV circuit from PREPA. The circuit serves Substation A. There is a meter at this service point. 1/0 Cu conductors are suspended from wood poles and connect the service point to Substation A. (HSMM/2001).

It should be noted that both underground and aerial power lines service the housing areas, making one of the systems redundant. Underground conduits for cable and telephone are also in place for housing but cables for these utilities were never installed.

Substation C

Substation C is located along Langley Drive near the intersection with Marina by-pass. The 38 kV line enters and exits the station on a primary steel structure and there is a 38 kV tap to each of two transformers. Transformer A is a 5000 kVA 38 kV-13.2 kV unit, is protected with a 38 kV breaker and Transformer B is a 1500 kVA 38 kV-13.2 kV unit. Transformer A supplies a main breaker and three distribution breakers. The fenced area is 87'X66'. Table B.3 shows the transformers at Substation C.

Table B.3
Transformers
Substation C

Name	Capacity (MVA)	Primary Voltage(kV)	Secondary Voltage(kV)
<i>Transformer A</i>	<i>5000</i>	<i>38</i>	<i>13.2</i>
<i>Transformer B</i>	<i>1500</i>	<i>38</i>	<i>13.2</i>

The substation distributes 13.2 kV via 3 feeders: the first of which services 19 transformers, the second 24 transformers and the last 9 transformers at which points the voltages are reduced to 120/240, 208/120, 480/277 V. The feeders and subsequent transformers serviced by each feeder were noted to be in fair to good condition. (HSMM/2001)

Substation D

Substation D is located between Langley Drive and Nimitz Drive. Circuits 13800 and 5500 enter Substation D from the Daguao Service and then split into individual outgoing 38 kV feeders. There is a 38 kV breaker that protects a 5000 kVA 38 kV-13.2 kV transformer. The transformer serves four 15 kV distribution circuit breakers in a walk-in metal-clad outdoor enclosure. The fenced area is 79'X79'. The substation was replaced during the late 1990s. Table B.4 shows the transformers at Substation D.

Table B.4
Transformers
Substation D

Name	Capacity (MVA)	Primary Voltage(kV)	Secondary Voltage(kV)
<i>Sub D</i>	<i>5000</i>	<i>38</i>	<i>13.2</i>

The substation distributes 13.2 kV via four feeders: the Nimitz feeder which services 7 transformers, the FWTC Feeder which services 9 transformers, the Elem School Feeder which services 17 transformers and the Sub C & Swamp Feeder which services 15 transformers. These transformers then provide 120/240, 208/120, 480/277 V to other service points. The 13.2 kV feeders and subsequent transformers and switches were noted to be in fair to good condition. (HSMM/2001)

Substation T-492

Substation T-492 is a small substation that feeds three buildings at 480 V. A single 38 kV circuit enters the substation and terminates at a switch mounted on top of a steel structure. The transformer is protected with 38 kV fuses mounted below the switch. As of April 2001 a new transformer and secondary switchgear were scheduled to be installed. The fenced area is 47'X34'. (HSMM/2001)

Substation I

Substation I is fed from the 38 kV overhead distribution system. There is a 5000 kVA 38 kV-13.2 kV three-phase transformer protected with a 38 kV three phase breaker. The transformer feeds a main 15 kV breaker and three 15 kV circuit breakers. Two distribution circuits, service 23 and 130 transformers, respectively. These transformers then provide 120/240, 208/120, 480/277 V to other service points. The transformers fed from these feeders were noted to be in fair to good condition with the exception of T-364 and T-373. The fenced area for Substation I is 61'X61'. Table B.5 shows the transformers at Substation I. The transformer was noted to be in fair condition (HSMM/2001).

Name	Capacity (MVA)	Primary Voltage(kV)	Secondary Voltage(kV)
<i>India</i>	<i>5</i>	<i>38</i>	<i>13.2</i>

Table B.5
Transformers
Substation I

Pier 2 Substation

Pier 2 Substation is served from the overhead 38 kV distribution system. There is a 38 kV switch and 38 kV transformer fuses. The transformer secondary serves a 480 volt main breaker and eight distribution circuit breakers. The eight distribution breakers serve the shore power stations on Pier 2. The fenced area is 37' x 24'. Table B.6 shows transformers at Pier 2 Substation. (HSMM/2001)

Table B.6
Transformers Pier 2 Substation

Name	Capacity (MVA)	Primary Voltage(kV)	Secondary Voltage(kV)
<i>Pier 2</i>	<i>2</i>	<i>38</i>	<i>0.48</i>

Pier 3 Substation

Pier 3 Substation is served from the overhead 38 kV distribution system. Both station transformers are on one set of 38 kV fuses and each transformer serves a separate 480 volt bus. Each bus has 12 distribution circuit breakers and all 24 of the 480 volt circuits provide power to the shore power stations on Pier 3. The fenced area is 60' x 37'. Table B.7 shows the transformers at Pier 3 Substation. (HSMM/2001)

Table B.7
Transformers Pier 3 Substation

Name	Capacity (MVA)	Primary Voltage(kV)	Secondary Voltage(kV)
<i>Pier 3</i>	<i>2.5</i>	<i>38</i>	<i>0.48</i>
<i>Pier 3</i>	<i>2.5</i>	<i>38</i>	<i>0.48</i>

Bundy Substation

The Bundy substation is located along Bennington Road, south of the golf course. The Bundy Substation is fed from the overhead 38 kV distribution system. There are two 1500 kVA, 38 kV–4.16 kV transformers each supplying a 4.16 kV breaker and distribution circuit. The fenced area is 60' x 40'. Table B.8 shows the transformers at Bundy Substation.

Table B.8
Transformers BundySubstation

Name	Capacity (MVA)	Primary Voltage(kV)	Secondary Voltage(kV)
<i>Bundy 1</i>	<i>1.5</i>	<i>38</i>	<i>4.16</i>
<i>Bundy 2</i>	<i>1.5</i>	<i>38</i>	<i>4.16</i>

The transformers were noted to be in fair condition. The secondary circuits, Bundy 1 and Bundy 2 service 27 and 76 transformers, respectively which in turn provide 120/240, 208/120, 480/277 V service.

FDR Substation

The FDR Substation is located along FDR Drive at Saratoga Road. The FDR Substation is fed at 38 kV from overhead Circuit 5500, which passes through the station. The transformer primary is tapped from the overhead line with a Gang-Operated Air-Break (GOAB) switch which feeds an SF6 circuit breaker. This circuit breaker in turn feeds a 5000 kVA, 38–4.16 kV transformer. The substation is enclosed in a fence (39' x 49').

The transformer was noted to be in good condition. Two feeders supply 4.16 kV to 31 and 51 transformers, respectively which in turn supply 120/240, 208/120, 480/277 V to various points.

Coral Sea Substation

The Coral Sea Substation is served from the 38 kV overhead distribution circuit number 5500. The 38 kV overhead terminates on the steel structure before going to the transformer which is 5000 kVA 38 kV-4.16 kV substation type unit. As of April 2001, there was an additional transformer inside the fence which was disconnected and not in service.

Three secondary feeders provide 4.16 V to 69, 54 and 31 transformers, respectively. These transformers then provide 120/240, 208/120, 480/277 V to various points.

Substation A

Substation A is fed from the overhead 38 kV Airport Service distribution. There are two 1500 kVA 38 kV-13.2

kV transformers. The fenced area is 71' x 45'. Substation A is equipped with primary metering. The transformers were noted to be in fair condition. AA Feeder Ckt 1 supplies 13.2 kV to 13 transformers and AB Feeder Ckt 1 supplies the same voltage to 51 transformers. (HSMM/2001)

Substation 24

Substation 24 is located on the airfield, east of Bldg 1749. Substation 24 is a small station on the airfield fed underground from Substation A, 13.2 kV, AB Feeder Ckt 1. The transformer is a 500 kVA 13.2 kV-2.4 kV unit that feeds a bank of transformers for airfield lighting. The fenced area is 37' x 22'. The transformer at substation 24 were noted to be in fair condition.

**Tele-
Communications**

Information received to date indicates manholes and fiber optic cable for the telecommunications system. It is assumed that this equipment is for data transmission. Refer to Figure B.16 for a layout of system.

Appendix A.c:
Existing Building Assessment

Appendix A.c

Existing Building Assessment

Building Evaluation Criteria

The building evaluation criteria were developed to aid in the analysis of the existing conditions assessment of the buildings and structures on the US Naval Station Roosevelt Roads. An initial site analysis resulted in a division of the Base into 8 distinct Zones. Each zone is distinguished both by location and overall usage. Further analysis of the facilities resulted in categorization and assessment of each facility based on qualitative and quantitative criteria. The most important of these include:

- Construction Type: Concrete masonry, metal or wood
- Building Type: Based on usage
- General Condition: Very Good to Poor
- Building Value: High to Low
- Adaptive Re-use: Highly to Poorly Adaptable
- Area: in Square Feet (SF)
- Facility Number: assigned by the Navy
- Year of Construction
- Number of Stories
- Facility Name: assigned by the Navy
- View: rated 0 to 3 with 3 being the most desirable views
- Operationally Significant: Yes or No

While some of these criteria are self-evident others require judgments to be made by the evaluation team. The more significant of these criteria are described further on the following pages.

Zones

Historically, the facilities were developed in distinct building campaigns that supported the expansion of military operations at Roosevelt Roads. Seventy-five percent (75%) of the buildings and structures were built before 1960. For the purpose of our analysis we divided the Base into eight (8) geographic zones with corresponding sub-zones, representing distinct groupings or land uses on the Base.

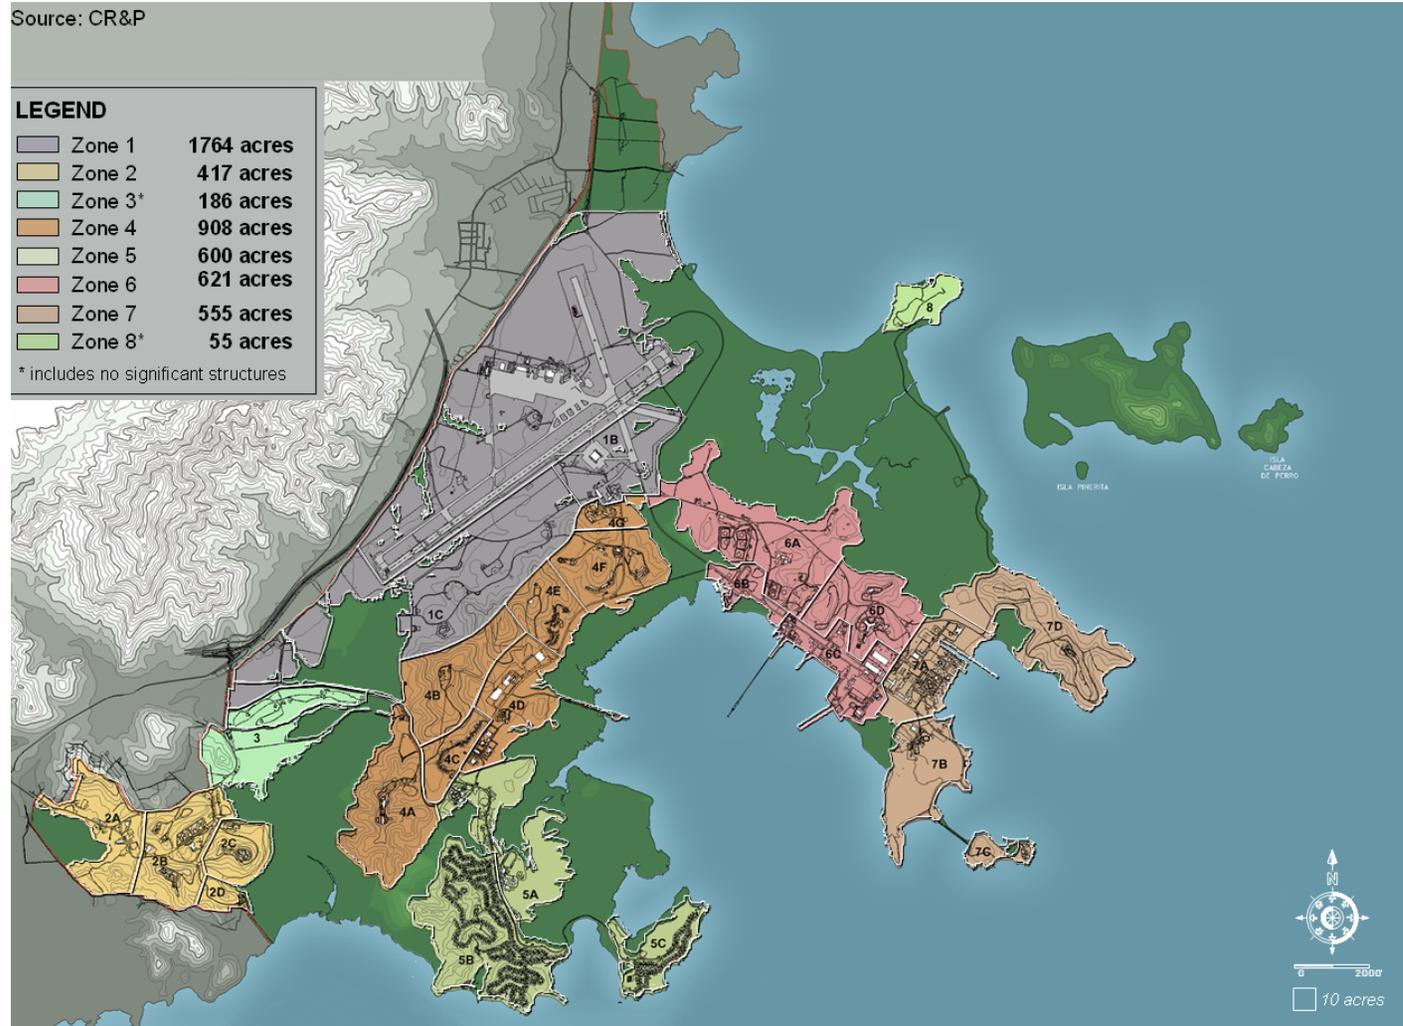

Figure C.1
Study Zones

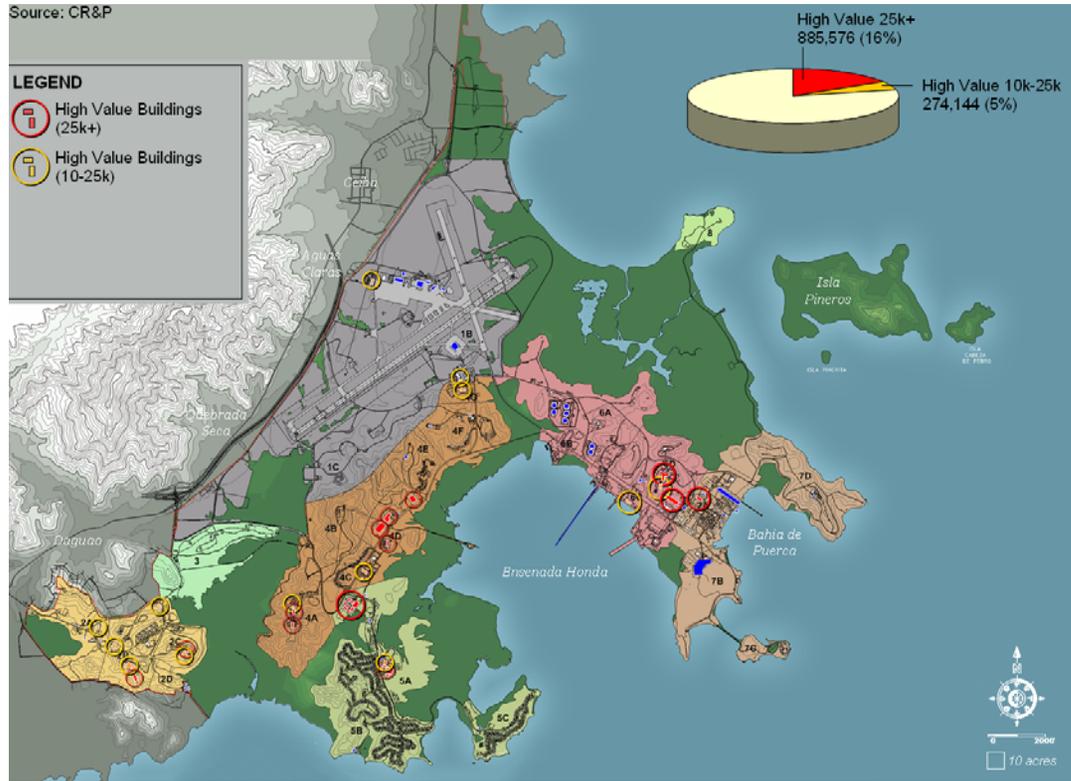

Source: CRP

Building Type

Each building and facility was categorized by type in accordance with the Building Use and Occupancy Classifications of the 2003 edition of the International Building Code (IBC). The IBC was chosen because the United States Government recently adopted the IBC for all of its facilities. Military, Educational and Recreational use categories were added to supplement the IBC designations in order to provide a fine grain description of the existing facilities.

Figure C.2
High Value Buildings

Source: CRP

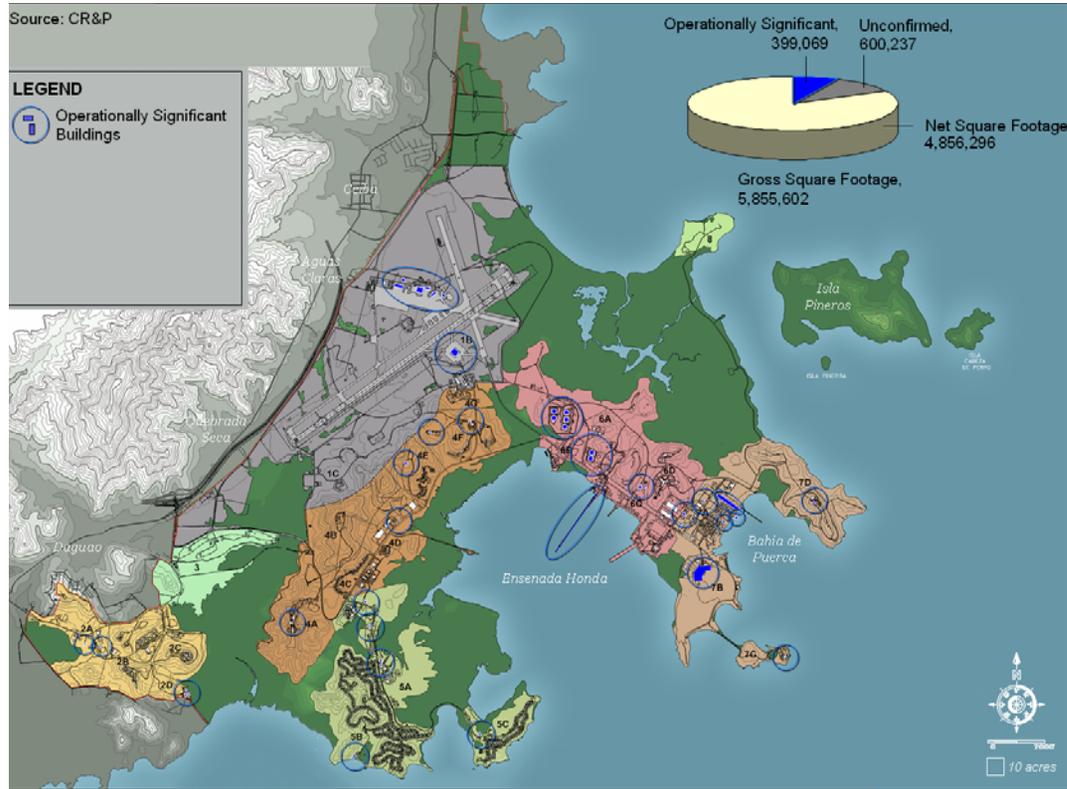

Building Value

High Value: Facilities categorized as High Value were sited on the base map. High Value facilities include those that offer a significant use or adaptive re-use opportunities in their current location, or, in the case of residential buildings, are over 3,000 SF and have been recently renovated. Due to their significant value, retention of high value facilities should be given careful consideration in any future re-use plans.

Figure C.3
Operationally Significant

Source CRP

Medium Value: Facilities with a medium value are those that are in very good or good condition, are well constructed, are varied in their potential re-use adaptability or have a good view. Medium value facilities can be adapted to complement a variety of proposed land uses. Facilities categorized as medium value have development potential and would require a more in-depth assessment to evaluate their true value relative to specific re-use proposals.

Low Value: Facilities with a low value are those structures that are in fair or poor condition, obsolete, or poorly constructed and/or usually pre-fabricated metal buildings having square footages typically in the range of 10,000 SF or below and have little to no view. Low value buildings and structures should be carefully considered for demolition in any proposed reuse plan.

Operationally Significant

Facilities characterized as "Operationally Significant" include a broad range of facilities that provide necessary support to the base utility infrastructure, the airport facilities and the seaport facilities. These buildings are usually concrete or steel framed structures and in good condition.

Figure C.4
Operationally Significant Airport

Source CRP

Some of the infrastructure facilities serve Base-wide or multi-zone areas. However, it should be noted that even some of these facilities could easily be adapted to serve individual zones or sub-zones in the future without compromising the overall base infrastructure. Facilities related to the airport include the air traffic support buildings, aircraft maintenance, fuel storage facilities, cargo handling facilities and the fuel pier. Facilities related to the seaport include the support buildings required to maintain the vessels and the fuel storage facilities. The berthing piers and bulkheads are not considered as operationally significant since they would require modifications to accommodate recreation or civilian commercial vessels

Summary of Facility Assets

The team performed on-site visual assessment of NSRR facilities during an extensive four-day inspection on February 24-27, 2004. Sources for this study include the Consultant Team review of the following reports and construction documents provided by the Navy.

- Navy’s NSRR Buildings and Structures 110503;
- NSRR Super Map;
- LawGibb Group NSRR Architectural Resources Inventory and Evaluation Study, June 8 2001;
- Various construction documents and information provided by the Navy’s on-site personnel.

Overview of Existing Facilities

There are over 1,600 listed facilities including buildings and other structures at Roosevelt Roads comprising more than 5,800,000 square feet (SF). Buildings range in size from the largest—the Public Works Building at 120,640 SF, to the smallest—a 64 SF utility building. The average building size is 3,600 SF.

Of the approximate 5,800,000 SF of listed facilities nearly 7%, or 399,069 SF, are deemed to be “Operationally Significant” and are essential to the on-going operation of NSRR’s existing infrastructure, its port and its airport.

These include such facilities as the fuel pier, the main hangar at the airport, jet fuel tanks, the sewage treatment plants, etc.

Another 600,237 SF of listed facilities are “Unconfirmed” at this time with respect to condition, use or location resulting from inconsistencies or omissions from the reference data provided by NSRR. This will require additional time and research to resolve and is outside of the scope of this effort.

Net Square Footage Allocations

The Net Square Footage of built facilities that we will consistently reference totals 4,856,296 SF. This Net Square Footage derives from the total of approximately 5,800,000 SF and excludes those facilities identified as “Operationally Significant” (399,069SF) or “Unconfirmed” (600,237 SF).

In broad terms the general use of the facilities breaks down as follows:

- There are more than 801 Residential buildings including single and small scale multi-family dwellings, apartment houses and a hotel. These buildings comprise 2,417,010 SF, or 50% of the net square footage.
- There are also facilities in use as commercial, retail, offices and industrial facilities. These approximate 1,225,000 SF in area, or 25% of the net square footage.
- Educational, institutional and public amenity purpose buildings comprise 370,000 SF or 8% of the net square footage; and
- Storage structures (both in permanent structures or metal buildings) comprise 541,621 SF and represent slightly more than 11% of the net square footage.
- The remaining square footage serves municipal, utilitarian, military or open space recreational functions and comprises approximately 302,700 SF, or 6% of the total.

Subtotal	4,856,296 SF	100%

Facilities Assessment

With a few exceptions, the prevailing condition of the existing facilities at NSRR is good. This may be attributable to the degree of maintenance provided over the years by a combination of Navy personnel and civilian employees.

There are a number of newly constructed facilities at NSRR that have just been completed but never occupied. These include a new office building and a new barracks for the Navy Seals. Another project just nearing completion is the new BEQ (Bachelors and Enlisted Quarters) residential facility.

In addition, a number of facilities have been recently renovated. These include the Navy Exchange, the Hospital, the Commissary, and a number of single family residential buildings.

With consistency, most facilities at the base were sited, designed and constructed for functionality and lack any sense of specific aesthetic quality or architectural style. Similarly, their access, siting and open space are absent any landscape design.

A number of buildings were scheduled for renovation or gutted in anticipation of an imminent renovation. They remain in that unusable condition.

Numerous buildings, particularly some of the older metal storage buildings, are obsolete or deteriorated and are candidates for removal.

Figure C.5
BEQ Apartments

Notes by Selected Facility Type

Residential: Existing housing stock at NSRR includes 801 single and multi-family residential facilities comprising 2,417,010 SF.

Of those, 676 are single family dwellings comprising 1,233,185 SF, or 51% of the total residential building area. The majority of single family houses are small, concrete block structures with punched windows and low-sloped built-up roofs and range in size from 1,600 to 2,000 SF. Larger single family structures, typically allocated as officer's housing, are similar in style and approach 3,000 SF. Of the 676 single family dwellings, 319 have been recently renovated.

Another 98 buildings consist of small multi-family dwellings designed to accommodate 2 to 8 families. These comprise 474,000 SF, or 20% of the total residential area.

The remaining 29% of the residential area is made up of 27 Large Scale Multi-family or Lodging buildings, comprising 710,000 SF.

Operationally Significant: Facilities in this category include those necessary for basic infrastructure and utilities, airport operation and port usage. Excluding Pier 3, there are 113 Operationally Significant structures on the Base comprising 399,000 SF. This amounts to 7% of the total built area for the Base and about 7% of the total number of facilities.

High Value Facilities: Buildings and structures in this category include those that are necessary to support utility or port infrastructure, offer a significant public amenity in their current location (e.g. hospital) or, in the case of residential buildings, have been recently renovated.

This category includes many small structures. Excluding facilities under 3,000 SF in area, there are a total of 116 High Value structures totaling 1,700,000 SF in area. This is approximately 29% of the 5,800,000 SF total built area on the Base.

In terms of size breakdown of the High Value facilities there is 933,000 SF in facilities over 25,000 SF, 335,000 SF in facilities between 10,000 SF and 25,000 SF in area and 401,000 SF in facilities between 3,000 SF and 10,000 SF in area.

Sources :

Buildings and Structures Inventory - Excel File: *NSRR Bldgs and Struct 110503* is the base information used to compile the list of facilities

AutoCADD drawing: *NSRR super-map-Prenew-xref* is the base drawing used to locate the buildings within the zones and sub-zones

LawGibb Group *NSRR Architectural Resources Inventory and Evaluation Study* dated June 8, 2001 was used to formulate base existing conditions of each of the catalogued structures

Various Construction Documents and other information provided by the Navy's on-site personnel.

An extensive visual assessment of the facilities by the design team was conducted during a four-day site visit between February 24-27, 2004

SUMMARY

Residential Use Types		Square Footage by Type	No. of Bldgs.	No. of DU's
Hotel	Navy Lodge	73,751	1	55
Apt. Bldgs.	BEQ / BOQ	604,526	24	1003
Assembly	Officers Living Room	32,258	2	2
Eight	Enlisted Housing	16,336	2	16
Quad	Enlisted Housing	199,314	33	132
Duplex	2 unit residential	257,640	63	126
Single	Enlisted and Officer	1,233,185	676	676
Total Square Footage		2,417,010	801	2,010 Total

Sources:

Buildings and Structures Inventory - Excel File: *NSRR Bldgs and Struct 110503* is the base information used to compile the list of facilities

AutoCADD drawing: *NSRR super-map-Prenew-xref* is the base drawing used to locate the buildings within the zones and sub-zones

LawGibb Group NSRR Architectural Resources Inventory and Evaluation Study dated June 8, 2001 was used to formulate base existing conditions of each of the catalogued structures

Various Construction Documents and other information provided by the Navy's on-site personnel.

An extensive visual assessment of the facilities by the design team was conducted during a four-day site visit between February 24-27, 2004

SUMMARY

Building Type - International Building Code 2003 - Use and Occupancy Classification		Square Footage by Building Type	No. of Faci
Assembly	Theaters, Restaurants and Churches	0	0
Business	Airport, Post Offices, Radio and TV Stations	20,988	1
Educational	K thru 12 Schools and Day Care Facilities	0	0
Industrial	Factories, Manufacturing and Assembly	69,725	15
High Hazard	Storage of Hazardous Materials and Explosives	50,852	26
Institutional	Assisted Living Quarters, Hospitals and Correctional Facilities	0	0
Retail (Mercantile)	Department Stores, Markets and Fuel Stations	0	0
Residential	Hotels, Apartment Buildings and Single Family Houses	0	0
Storage	Repair and Storage Facilities	4,450	3
Utility	Aircraft hangars, carports and towers	199,248	10
Military	Supports military operations	0	0
Municipal	Infrastructure supporting facilities	53,806	58
Recreation	Residential recreation	0	0
Total Square Footage		399,069	113 Total

Note: The total square footage and total number of facilities include above ground buildings and structures only.

P/N: 5275 Naval Station Roosevelt Roads

Re: Container Terminal Possibilities at Naval Station Roosevelt Roads

A container terminal was considered as part of the base reuse plan for Naval Station Roosevelt Roads. Such a facility would accommodate Post-Panamax vessels, include a total berth length of 5,000 feet, and a backlands area of approximately 172 Acres for container storage. Using high density storage estimates, the resulting port would have a capacity of one million teu/year. This preliminary investigation includes the major issues associated with constructing a container terminal at NSRR. It should be noted that other issues likely exist, such as permitting, environmental impacts and constructability for example, that are considered beyond the scope of this general overview. One major factor to consider is cost of developing a container terminal at NSRR. The two alternatives considered in this study would cost on the order of US\$1 billion and US\$850 million, respectively, for land development, dredging, paving utilities and terminal equipment. These costs do not take into account soil stabilization, building demolition, and many other considerable factors that could increase the above listed costs substantially. Significant issues with terminal development are described below:

Dredging and Navigation

The existing channel at Roosevelt Roads is dredged to a depth of 40 feet at a width of 1,000 feet. Several areas close to the bulkhead currently have depths between 32 and 38 feet below low water. A container terminal for Post-Panamax ships would eventually need a low water depth of 50 feet. In order for vessels to navigate safely into and out of Roosevelt Roads, dredging would be required seaward of the harbor. The navigation charts for this area also show that there are high spots in areas seaward of the harbor into Pasaje de Vieques and Pasaje Radas Roosevelt. To approximate the dredging required, a channel of approximately 250 meters was assumed and projected out to deep (-60 feet) water (see attached Sk 1). Dredging is required over a length of approximately 12 miles, but only in isolated locations where water is shallower than 50 feet. It is important to note that there are coral beds within this 12 mile channel and that coral removal would raise environmental issues.

Alternatives for Container Terminal

There is not currently sufficient area to locate a container terminal at Roosevelt Roads. In order to create a site of sufficient size, either filling a portion of the harbor or extensively excavating the hillside adjacent to the existing piers would be necessary, as indicated in the outline below.

- The land area north of the existing bulkhead is limited. In order to create a backland area of sufficient size, the existing hills would have to be excavated (Alternative A) or land area fronting the existing bulkhead will have to be reclaimed (Alternative B) (see attached Sk 2 and Sk 3). The cost associated with excavation or reclamation would be significant depending on geotechnical characteristics of the material to be excavated or to be used as fill. Both

options would require construction of a new bulkhead at the wharf face. Reclamation could be an environmental issue as it would cover existing bay bottom. In Alternative A, the proximity of the existing hospital may be problematic. The foundations for the hospital would likely require analysis and/or monitoring during construction to assure the foundation is not compromised by cutting into the hill it is currently built upon. In order to provide a stable plane at the face of the excavated hill, it is likely that a retaining wall of significant dimensions would need to be installed.

- The existing site may require some degree of environmental clean up (e.g. fuel storage tanks in the area and other potential sources of soil contamination.) Clean up cost is difficult to estimate without environmental sampling and testing.
- The existing fuel pier bisects the harbor and would have to be demolished to create berthing space. The fuel pier is likely to be critical to the operation of the airport, although airport operations are outside the scope of this study and are included in a Master Plan being developed by the Puerto Rico Ports Authority.

Demolition

With a berth length of 5,000 linear feet parallel to the bulkhead, the existing marina would need to be demolished. The fuel tank farm would need to be demolished under Alternative A. Substation India is also affected by the container terminal size and would need to be relocated, at a minimum, for each option. Other structures and utilities may need to be demolished for either alternative. These were not considered in this exercise and it should be noted that other issues likely exist.

Roosevelt Roads Reuse Plan

Landside Transportation Infrastructure and Off-terminal Land Area

Base roads are in fair condition and the port would be easily accessible to the existing highways. An analysis of truck traffic on the roads within the base would have to be completed to determine impacts on adjacent properties. At a minimum, it is likely that a dedicated port road would be required within the port area to separate port traffic from non-port traffic to and from Zones 6 & 7.

Available Areas for Value Added Warehousing

There are buildings in the area which could conceivably be converted to warehousing for performing value added functions.

Permits

Dredging, filling and construction permits, among others, would be required for either the excavation or reclamation. It could take several years to procure the necessary permits.

Cut and Fill Volumes

Alternative A would require dredging of approximately 20.4 million cubic meters of material (this does not include side slopes and pay overdepth which could add up to 20% additional material), excavation of approxi-

mately 5.8 million cubic meters of material from land and fill of approximately 243,000 cubic meters of material. Assuming site material is reusable as fill, this would result in total off site disposal of approximately 26 million cubic meters of material.

Alternative B would require dredging of approximately 17.4 million cubic meters of material (this does not include side slopes and pay overdepth which could add up to 20% additional material), excavation of approximately 580,000 cubic meters of material from land and fill at wharf face of approximately 10 million cubic meters of material. Assuming site material is reusable as fill, this would result in total off site disposal of approximately 8.2 million cubic meters of material.

Construction Schedule

Landside construction could occur simultaneously with dredging, and consequently, this alternative could be completed in less time than Alternative B. For Alternative B, if dredge material was used to fill in the terminal storage yard, the site would have to be dewatered and possibly surcharged to stabilize it before constructing bulkhead and dredging berths.

Roosevelt Roads Reuse Plan

TOTAL				\$1,073,400,000				\$856,400,000

Notes: Assumptions and Exclusions:

- Demolition costs include pier demolition only. The proposed port is located in previously developed area. As such, a significant amount of demolition is required to construct the port, including buildings, fuel tanks, etc. *Cost of that demolition is not included here.*
- It is assumed that all dredge waste materials are disposed of at sea.
- Fill is included under dredge cost. Surcharging and/or wick drains to consolidate dredged materials used as fill may be required—the need for soil consolidation *will significantly increase project cost and schedule. Cost of soil stabilization is not included here.*
- For Alternative A, cut includes hauling offsite. For Alternative B, cut includes hauling onsite for

- use as fill. It is assumed that all materials are excavated with hydraulic excavators—no provisions made for drilling and blasting. It is assumed that a retaining wall would be required at the face of the excavated hill to stabilize the hill. *Cost of wall is not included here.*
- It is assumed that road improvements would be required outside of the port's limits. *Cost of road improvements not included here.*
- Cost of relocating Substation India is not included.*
- Environmental concerns have not been accounted for. This includes land reclamation (Alternative B) and permitting for both alternatives. *Costs for environmental remediation and mitigation are not included here.*
